| List of Electives | |
|---|---|
| Department Elective (Sem V, Sem VI, Sem VII) (Tentative, more options to be added) | Open Elective (Sem V, Sem VI, Sem VII) (Tentative, more options to be added) |
| <i>Artificial intelligence</i> | <i>Idea to business model</i> |
| <i>Foundation of Blockchain and Smart Contracts</i> | <i>Numerical and scientific computing</i> |
| <i>Multi-dimensional and NoSQL databases</i> | <i>Advanced statistics</i> |
| <i>Mobile application development</i> | <i>Introduction to Robotics</i> |
| <i>Game design and development</i> | <i>Integrating design, technology and business</i> |
| <i>Digital Image Processing and Introduction to Quantum Computing</i> | <i>Introduction to IoT and automation project</i> |
| <i>Computer vision</i> | <i>Computational game theory and applications</i> |
| <i>Big Data Engineering</i> | <i>Fundamentals of investing</i> |
| <i>Full Stack Web Development with REACT</i> | <i>Operations research</i> |
| <i>Cloud Computing Architecture</i> | <i>Behavioral assessments for employability</i> |
| <i>Software Engineering</i> | <i>Solid and e-waste management</i> |
| <i>Compiler Design</i> | <i>Disaster management</i> |
| <i>Cryptography</i> | <i>Smart Materials</i> |
| <i>Cyber Security</i> | <i>Fundamental of sustainable development</i> |
| <i>Deep Learning</i> | <i>Motion Planning, Control, and Manipulation of Robots</i> |
| | <i>Project in Robotics</i> |
| SEE-I/SEE-II (Tentative) | <i>Mechanics of Robots</i> |
| <i>Virtual Reality Lab</i> | <i>Flexible Electronics</i> |
| <i>Geographical Information Systems Lab</i> | <i>Neuromorphic Engineering</i> |
| <i>Robotic Process Automation Lab</i> | <i>Digital Logic Verification</i> |
| <i>Google Cloud Lab</i> | <i>Mechanisms for Machines</i> |

INDEX OF COURSE DESCRIPTIONS

| B. Tech (CSE) (Batch: 2022-2026) | | | | |

|--|--------------------------------|
| Course Title and Code: C Programming and Data Structures (CS1132) | |
| Hours per Week | L-T-P: 4-0-4 |
| Credits | 6 |
| Students who can take | B.Tech. Semester III (CSE+CCE) |
| Prerequisites | Programming I |
| Evaluation | Theory 70% Lab 30% |
| <p>Course Objective: In this course, students will first learn the basics of C programming and then explore the concepts of algorithms and data structures. This course aims to develop a good understanding of Data Structures concepts and its implementation to solve various computational problems using C and C++. Main topics are Complexity analysis (time & space), Recursion, Linear Data Structures (Arrays, Queue, Stack, Linked list), Searching, Sorting, Non-linear data structures (Trees, Graphs), Indexing and Hashing.</p> | |
| <p>Learning Outcomes:</p> <p>On the successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Write simple programs using C 2. Have a good understanding of different data structures stacks, queues, lists, trees and graphs 3. Learn the implementation of above data structures in C and C++ by writing programs for performing the basic operations like insertion, deletion, searching, traversal, etc. 4. Develop skills to apply appropriate data structures in problem solving. 5. Analyse the algorithms in terms of asymptotic time and space complexity. 6. Implement and compare various searching and sorting algorithms. 7. Understand recursion and its implementation. | |

Syllabus (Theory)

Unit-1: Basics of C: Introduction to C, Variables and Data Type, Input output, Flow Controls, 1-D and 2-D arrays, Loops, Functions, Strings, Pointers, Handling arrays through pointers, Pointer arithmetic, Passing pointers as parameters to functions, Pointers for inter-function communication, Structures: typedef and struct keywords, dot and arrow operators, nested structures, structs containing arrays, structs containing pointers, pointer to struct, passing struct through pointers. Dynamic memory allocation, Basic file handling.

Unit-2: Writing algorithms for simple problems, Understanding Analysis of time and space complexity, Big O notation, Evaluating complexity for simple problems.

Unit 3: Types of Data Structures: Linear & Non-Linear, Concepts of different linear structures: Arrays, Stacks, Queues, Linked list, Understanding Operations, Implementation and Applications of Stacks, Queues, Linked list. Evaluation of expression in infix, postfix & prefix forms using stack, Queues: Circular Queues: Operations and Applications, De-queue and Priority queue, Sparse matrix, Recursion.

Unit -4: Sorting and searching algorithms. Linear and binary search, insertion sort, selection sort, bubble sort, merge sort, quick sort. Complexity Analysis of different sorting and searching algorithms.

Unit-5: Non-linear Data Structures: Trees definition, characteristics, concept of child, sibling, parent child relationship etc., binary tree: its applications, insertion, deletion and traversal of binary trees, constructing binary tree from traversal results. Array-based implementation, Concept of Heap, Priority queue implementation using heap.

Binary Search Tree: Concept of BST, insertion into and deletion from BST, Height balanced tree: Introduction to AVL Tree, Application of trees for representation of sets.

Unit-6: Hashing, Introduction to Multiway search trees

Unit-7 Graphs: Directed and undirected graphs, representation of graphs using adjacency matrix and list, Depth first and breadth first traversal of graphs. Topological sorting

|---|--|
| Course Title and Code: Computer Organization and Architecture (CS1134) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech. CSE III Semester |
| Prerequisite | Digital circuit and systems |
| Weightage | Theory -65%, Practical and Assignments – 35% |
| <p>Course Objectives: To study the basic organization and architecture of digital computers (CPU, memory, I/O, software). Such knowledge leads to a better understanding and utilization of digital computers and can be used in the design and application of computer systems or as the foundation for more advanced computer-related studies.</p> | |
| <p>Course Outcome: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Draw the functional block diagram of the single bus architecture of a computer and describe the function of the instruction execution cycle, RTL interpretation of instructions, addressing modes, and instruction set. 2. Summarize and compare different computer systems. 3. Categorize different types of computers based on Instruction set Architecture. 4. Develop assembly language programs for multiplication, division, and I/O interface using 8086. 5. Given a CPU organization and instruction, design a memory module and analyze its operation by interfacing with the CPU. 6. Write a flowchart for Concurrent access to memory and cache coherency in Parallel Processors and describe the process. 7. Given a CPU organization, assess its performance, and apply design techniques to enhance performance using pipelining, parallelism, and RISC methodology. 8. Analyze the performance of pipeline and cache-based systems. | |

Course Syllabus (Theory):

Unit I: BASIC STRUCTURE OF COMPUTERS: Review of Digital Logic and Systems, Functional units, Von Neuman and Harvard Architecture Basic operational concepts, Bus structures, PCI, Multiple bus organization, Performance, and metrics,

Unit II: BASIC PROCESSING UNIT: Fundamental concepts, Execution of a complete instruction, The Arithmetic and Logic Unit (ALU), Number Systems, Fixed point representation, and Arithmetic, Floating Point Representation and Arithmetic, Hardwired control, Micro programmed control.

Unit III: INSTRUCTION SETS: Characteristics and functions, x86 Architecture, Instruction set architecture, Addressing modes and formats, RISC and CISC.

Unit IV: PIPELINING: Basic concepts, Data hazards, Instruction hazards, Influence on instruction sets, Data path, and control path, Performance considerations, Exception handling.

Unit V: MEMORY SYSTEM: Basic concepts, Memory Hierarchy, Semiconductor RAM, ROM, Speed, Size and cost, Cache memories, Improving cache performance, Virtual memory, Memory management requirements, Associative memories, and Secondary storage devices.

Unit VI: I/O ORGANIZATION: Accessing I/O devices, Programmed Input/Output, Interrupts, Direct Memory Access, I/O devices, and processors.

Unit VII: PARALLEL PROCESSING: The use of multiple processors, Symmetric Multiprocessors, Cache coherence, UMA, and NUMA.

|---|---------------------|
| Course Title and Code: Database Management Systems (CS1133) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech. III Sem |
| Prerequisites | None |
| Weightage | Theory 55% Lab 45% |
| Course Objective: This course aims to introduce the concepts of databases and database management systems. At the end of the course, students will have a good understanding of relational data model, relational query languages, database processing, SQL, transaction management and database recovery. | |
| Learning Outcome: On successful completion of this course, the students should be able to: <ol style="list-style-type: none"> 1. Understand data and relational database concepts 2. Model high level system requirements using conceptual modelling (ER) 3. Develop relational and physical database design 4. Compose queries using SQL 5. Apply Transactions to a real application 6. Understand algorithms and techniques to recover from data loss | |

Course Syllabus (Theory):

Unit 1: Introductory Concepts of Data - Transactional, Analytical and Master Data, Structured, Unstructured and Semi Structured Data, Data file and Database - Data File systems versus Database, Database system concepts and architecture along with logical database and physical database concepts.

Unit 2: Conceptual Database Design - High-level conceptual modeling, ER Modeling concepts, ER Diagrams, Cardinality constraints, Higher-order relationships: Aggregate and Specialization, ER to relational mapping.

Unit 3: Querying Relational Data: Structured Query Language - data definition language, integrity constraints, data manipulation language, data control language. Simple queries, queries using Joins, using aggregate functions. Joins - inner, left outer, right outer, full outer and cross joins. Updates and updates with joins, Relational Algebra and Relational Calculus.

Unit 4: Relational Schema Refinement and Normal Forms - Functional dependencies, Armstrong Axioms, Concept of Closure: Attribute and FD, Normal forms upto Boyce-Codd Normal Forms

Unit 5: Transaction Processing and Concurrency Control - ACID properties, Transaction states, Concurrency issues, Conflict-serializability, View serializability, Concurrency control: Locking, Time stamp ordering, Cascading rollbacks, Deadlocks and starvation, Physical Database Design, Database Recovery Techniques.

| | |
|---|---------------------|
| Course Title and Code: Differential Equations (AS1113) | |
| Hours per Week | L-T-P: 2-0-0 |
| Credits | 2 |
| Students who can take | B.Tech. III Sem |
| Pre-requisite | None |
| Evaluation | Theory – 100% |
| Course Objective: The primary objective of the course is to develop a good understanding of ordinary differential equations. This includes learning different methods and techniques for solving first-order and higher-order ODEs. In addition to analytical methods, the course covers numerical methods for approximating solutions to ODEs. | |
| Learning Outcome: On successful completion of this course, the students should be able to: 1. solve a range of ODEs, including first-order ODEs and higher-order linear ODEs. 2. apply numerical methods, such as Euler's method, and Runge-Kutta methods to approximate solutions of ODEs. 3. apply the knowledge of ODEs to model and solve real-world problems in various scientific and engineering disciplines. | |

Course Contents:

Introduction to Differential Equations, Order, and Degree of DE.

First Order Ordinary Differential Equations: Direction fields, Separable form, Exact differential equations, Integrating factors, Linear differential equations. Numerical methods: Euler's method, Modified Euler's method, Runge-Kutta method.

Second and higher order linear ODE with constant coefficients, non-homogeneous linear differential equations with constant coefficients, Euler-Cauchy equations, Method of variation of parameters, Method of undetermined coefficients, System of linear differential equations with constant coefficients.

Textbook:

1. Advanced Engineering Mathematics, Erwin Kreysig, 9th edition, John Wiley & Sons, 2005.
2. A Friendly Introduction to Numerical Analysis, Brain Bradie, Pearson, 2006.

Reference Books:

1. Advanced Engineering Mathematics, Wylie and Barrett, 6th edition, McGraw Hill, 2003.
2. Numerical Analysis, Richard L. Burden and J. Douglas Faires, 9th edition, Brooks/Cole, Cengage Learning, 2011.
3. Numerical Methods for Scientific and Engineering Computation, M. K. Jain, S. R. K. Iyenger, R. K. Jain, 5th edition, New Age International Limited Publishers, 2007.

|---|---------------------|
| Course Title and Code: Essentials of Management & Business | |
| Hours per Week | L-T-P: 3-0-0 |
| Credits | 3 |
| Students who can take | B. Tech III Sem |
| Pre-requisite | None |
| Evaluation | Theory – 100% |
| <p>Course Objectives: This course explores the basic concepts, processes and practices of management in managing business organizations. It focuses on providing understanding of management and its application in all types of businesses. It also helps students to understand how organizations develop and maintain competitive advantage within a changing business environment. The course will involve more of interactive sessions and open discussions within the class. The students are expected to come prepared to the class and actively participate in classroom discussions</p> | |
| <p>Learning Outcomes: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Appreciate multiple approaches to developing management as a field of study. 2. Comprehend the importance of managerial role in various functional areas for organizational performance 3. Identify the forces in business environment impacting organizations and its management practices. 4. Evaluate the relevance of management principles in alternative organizational context 5. Discuss current concerns in management theory and practices | |

Topics :

1. Managers and Management
2. Evolution of Management thoughts
3. Management Functions
4. Understanding Business Organizations as Systems
5. Business Environment
6. Business and Society
7. Modern Management Concepts and Practices

| Course Title and Code: Perspectives on Contemporary Issues (CC1103) | |
| Hours per Week | L-T-P: 2-0-1 |
| Credits | 2 |
| Students who can take | BBA/ Bdes/ B.Tech Sem III |
| Prerequisites | None |
| Weightage | Theory 60%, Practical 40% |
| Course Objective- | |
| In an era of globalization, there is an increasing need for the youth to be able to empathize with others, value diverse perspectives and cultures and understand how events around the world are intertwined. Global issues revolve around social, economic and environmental factors which ultimately add to the interconnectedness of countries. In this course, students will employ key critical thinking concepts to analyze contemporary issues from multiple perspectives. They will explore the impact at micro and macro levels. | |
| Learning Outcome : | |
| On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Identify different perspectives objectively. 2. Explain interconnectedness of the issues and their impact at micro and macro levels. 3. Recognize their own beliefs, biases, claims and assumptions. 4. Evaluate sources, argue and defend effectively. | |

Course Syllabus (Theory):

Research, analysis & evaluation of a topic from local, national and global perspectives.

➤ **Globalization**

With increasing development throughout the world, the focus of this theme will be on the impact of adopting policy of neoliberalism globally. Changes in India after implementation of new economic policy of 1991.

➤ **Poverty and Inequality**

What do you mean by wealth & equality? Is it enough to ascribe monetary values to human lives? Who has benefited from an increased access to resources, labour & capital due to globalisation? Which groups are historically marginalised & suffer from unequal access to opportunities

➤ **Social justice and human rights**

An understanding of the impact of inequality and discrimination, the importance of standing up for our own rights and our responsibility to respect the rights of others.

➤ **Climate Change and Sustainability**

Understanding the magnitude of the issue, its impact and future challenges. How we can meet our current needs without diminishing the quality of the environment or reducing the capacity of future generations to meet their own needs.

➤ **Technology**

Impact of unprecedented technological growth, challenges and opportunities. Is technocracy a boon or a bane?

| Weightage | Theory 60 % Practical 40 % |
| Course Objective: | |
| This course introduces an understanding of the design and analysis of algorithms. The course aims to develop familiarity with specific algorithms of significance and data structures. It further incorporates the ability to analyze performance and compute complexity of algorithms at best and worst case scenario. It will equip the students to apply important algorithmic design paradigms and methods to develop efficient algorithms for resolving computation and design related problems. | |
| Course Outcome: | |
| On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Analyze the complexity of different algorithms using asymptotic analysis. 2. Analyze and select an appropriate data structure for a computing problem. 3. Differentiate between different algorithm designs technique: Divide and Conquer Technique, Greedy, Backtracking, and Dynamic Programming. Also, recognize when an algorithmic design situation calls for using these. 4. Develop algorithms and programs using techniques like Divide and Conquer, Backtracking technique and Dynamic Programming to solve various computing problems 5. Develop energy-efficient algorithms and programs using Greedy approach to solve various computing problems, 6. Apply Query optimization algorithms using Greedy and Dynamic programming approaches. 7. Apply various search-based problem-solving methods , Heuristics, and Informed search . 8. Evaluate and apply appropriate energy efficient algorithmic design technique for solving complex computing problem. 9. Explain the ways to analyze randomized algorithms (expected running time, probability of error). 10. Differentiate between P, NP, NP-Complete, and NP-Hard problems. | |

Course Syllabus (Theory):

UNIT I: Introduction: Algorithms, Analyzing algorithms, Complexity of algorithms, Growth of functions, Performance measurements, Types of approaches.

UNIT II: Selection sort, Bubble sort, Insertion Sort, Shell sort, Quick sort, Merge sort, Heap sort, sorting in linear time: Radix sort, Counting Sort, Comparison of sorting algorithms, Divide and Conquer with examples such as Sorting, Matrix Multiplication, Convex hull and Searching

UNIT III: Greedy methods with examples such as Optimal Reliability Allocation, Knapsack, Minimum Spanning trees – Prim’s and Kruskal’s algorithms, Single-source shortest paths - Dijkstra’s and Bellman-Ford algorithms.

UNIT IV: Dynamic programming with examples such as Knapsack, all pair shortest paths – Warshal’s and Floyd’s algorithms, Resource allocation problem, Backtracking, Branch and Bound with examples such as Travelling Salesman Problem.

UNIT V: Selected Topics: String Matching, Huffman Coding, Theory of NP-completeness, Approximation

algorithms and Randomized algorithms.

|--|--|
| Course Title and Code: Machine Learning (CS1138) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech. IV Sem |
| Prerequisites | Computational Data Analysis (Python, Linear Algebra, Statistics) |
| Evaluation | Theory 75%, Lab 25% |
| Course Objective: This course introduces the fundamental concepts of machine learning and statistical pattern recognition. It will cover aspects of supervised and unsupervised learning. To be specific, linear regression, logistic regression, decision trees, random forests, SVM, clustering, PCA, KNN, etc will be taken up in detail. The course will also thoroughly cover gradient descent, its variants and regularization techniques. Towards the end, we will also introduce basics of neural networks and deep learning. | |
| Learning Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Judge whether a problem should be solved using machine learning. 2. Apply various techniques that are well suited according to the problem. 3. Apply regularization techniques to solve the problem of high bias and high variance. 4. Design machine learning models that are suited to solve a particular problem. 5. Build programs that implement the theoretical concepts learned in this course. | |

Course Syllabus (Theory):

Unit I: Motivation, learning paradigms, Applications of ML. Representations (features) extracted from data. Linear transformations, matrix vector operations in the context of data and its representations. Problem formulation: classification and regression. Probability distributions in the context of data, Prior probabilities and Bayes Rule. Introduce paradigms of learning: supervised and unsupervised.

Unit II: PCA and Dimensionality Reduction, Nearest Neighbours and KNN, Linear Regression, Decision Tree Classifiers, Generalization and overfitting. Training, Dataset partitioning and preprocessing. Model evaluation metrics, ROC curve.

Unit III: Ensembling and Random Forest, Linear SVM, K-Means, Logistic Regression, Naive Bayes.

Unit IV: Role of Loss functions, optimization, gradient descent and perceptron learning, MLP, Backpropagation, neural network classification and regression, regularization, early stopping, Introduction to Deep Learning and CNNs.

|---|---------------------|
| Course Title and Code: Operating System (CS1108) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech-CSE, Sem V |
| Prerequisites | None |
| Weightage | Theory 70%, Lab 30% |
| Course Objectives: The main aim of this course is to describe the structure and functioning of operating system. At the end of the course, the students will be well aware of the concepts of process management, memory management, file management and I/O hardware. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Use basic LINUX commands 2. Understand the structure of OS and its interface with hardware 3. Differentiate between different types of operating systems 4. Implement and assess the performance of different types of scheduling algorithms. 5. Have a good knowledge of process synchronization and Inter process communication, deadlock 6. Analyze and implement various disk-scheduling algorithms | |

Course Syllabus (Theory):

Unit 1: Introduction to OS – Concept of operating system, Generations of Operating systems, Types of operating system, Services, System calls, Structure of an OS-Layered, Microkernels, Virtual Machines, Case study on Windows and LINUX operating system

Unit 2: Process Management - Concept of process, Process states, Process State transitions, Process Control Block (PCB), Context switching, **Process scheduling:** Foundation and Scheduling objectives, Types of Schedulers.

Scheduling criteria: CPU utilization, Throughput, Turnaround Time, Waiting Time, Response Time. Scheduling algorithms: Pre-emptive and Non-preemptive, FCFS, SJF, Priority, R-R scheduling, Multilevel queue scheduling.

Inter process communication: Critical section, Race condition, semaphores, monitors, message passing,

Classical IPC Problems: Readers-Writer Problem, Dining Philosopher Problem etc. **Deadlock:** Shared resources, resource allocation and scheduling, resource graph models, deadlock prevention, deadlock avoidance, deadlock detection, deadlock recovery algorithms.

Unit 3: Memory Management - Memory management schemes, Contiguous/Non-contiguous memory allocation, storage management, paging, page table structure, segmentation, segmentation with paging, virtual memory, demand paging, page fault, Page replacement algorithms.

Unit 4: File Management - File concept, types and structures, attributes of a file, operations performed on file, File organization and access method, file allocation methods, directory structure, file directories, directory implementation.

Unit 5: I/O Hardware - I/O devices, I/O hardware, device driver, Kernel I/O sub-system, Interrupt. **Disk scheduling:** Disk Structure, FCFS, SSTF, SCAN, LOOK, C-SCAN, C-LOOK.

|--|--------------------------|
| Course Title and Code: Managing Business Functions (LS1109) | |
| Hours per Week | L-T-P: 3-0-0 |
| Credits | 3 |
| Students who can take | B. Tech IV Sem |
| Prerequisite | None |
| Weightage | Theory 60% Practical 40% |
| <p>Course Objectives: This course provides an overview of important functional verticals of any business organizations which work in integrated manner to ensure business performance. The course will provide an in-depth understanding of how management principles gets reflected in its practices and processes. The students will gain holistic understanding about how businesses run and relevance of its each functional departments in contributing towards its goal achievement. The students would discuss and diagnose real case scenarios to gain clarity about business function, identify problems and recommend practical solutions.</p> | |
| <p>Learning Outcomes: On successful completion of this course, the students should be able to</p> <ol style="list-style-type: none"> 1. Appreciate multiple functional verticals of business organizations. 2. Comprehend the connectedness of functional verticals in building successful business strategy. 3. Evaluate and analyse real business problems through an accurate synthesis of the information. 4. Identify the forces in business environment impacting organizations and its management practices. 5. Apply managerial knowledge, method and research techniques to identify and solve management problems | |

Topics :

1. Introduction to core business functional areas and its integration
2. Excelling Through People: Overview of HRM, Job Design, Recruitment and Selection, Training and Development
3. Accounting and Financial Analysis: Understanding Accounting as the Language of Business, Key Financial Statement, Analysis of Financial statements, Ratio Analysis, Goals and Functions of Finance.
4. Operations Management: Introduction to Operations Management, Operations Strategy, Quality Management, Supply Chain Management.
5. Creating and delivering Customer value: Defining Marketing and the Marketing Process, Marketing Strategy and Developing an Integrated Marketing Mix, Understanding Consumer Markets and Consumer Buying Behavior.

Readings:

|---|-----------------------------------|
| Course Title and Code: Communication and Identity (CC1104) | |
| Hours per Week | L-T-P: 2-0-1 |
| Credits | 2 |
| Students who can take | B.Tech/BCA/BBA/B.Des Semester- IV |
| Prerequisite | None |
| Weightage | Theory 40%, Practical 60% |
| <p>Course Objectives: This course enables students to explore their identities to mark their distinctive presence in professional spaces. It intends to help them gain an understanding of the basic purpose, benefits, and responsibilities of self-presence, and to begin the process of defining their values, strengths, and goals, which helps them enhancing their employability skills through exposing themselves through various activities.</p> | |
| <p>Course Outcomes: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Analyze their personal identities by identifying their personal attributes, values, strengths and vision statement. 2. Articulate their personal statement and use it to craft an influential pitch. 3. Express themselves professionally on various social media platforms. 4. Write a well-structured professional business document. | |

Course Topics

| Module(s) | Topics to be covered |
|--------------------------|---|
| Identifying Self | Discovering Identities: Words That Describe Me, Your Personal Identity, A Portrait of Yourself, Personal Identity Wheel, Self-Awareness from five aspects that influence our identity - Personal Attributes, Value and Principles, Emotional Awareness, Tendencies and Habit, Needs Assessment. |
| | Personal Branding: Meaning, Importance and how to create and use it; Identify, Build and Market your brand story. |
| Persuasive Communication | Personal Brand Statement, Resume, Cover Letter and The Elevator Pitch, Presence in Group Discussion and Personal Interviews |
| | Online Brand Communications- Creating an online presence for professional branding on social media platforms (LinkedIn, Facebook, Instagram, etc) |
| | Writing a well-structured and effective business documents (Agenda, Minutes of the meetings (MoM) Emails, Executive Summary) |

Referred MOOCs –

Course Name- Introduction to Personal Branding

Course duration - approx. 7 hours

Offered by University of Virginia

<https://www.coursera.org/learn/personal-branding>

Course Name- Digital Footprint (If I Googled you, what would I find?)

Course duration - approx. 9 hours

Offered by The University of Edinburgh

<https://www.coursera.org/learn/digital-footprint>

Course Name- High Impact Business Writing

Course duration - approx. 7 hours

Offered by University of California, Irvine

<https://www.coursera.org/learn/business-writing>

|---|-------------------|
| Course Title and Code: Practice School – I (PS-I), PS1101 | |
| Total Duration | 45 Days |
| Credits | 04 |
| Students who can take | B.Tech Semester-V |
| Prerequisite | None |
| Weightage | Practical 100% |
| Course Objective: | |
| The purpose of Practice School-I is to give an opportunity to re-understand their theoretical knowledge in the context of real life situations. | |
| Learning Outcomes: | |
| After course completion, the student will be able to: | |
| <ol style="list-style-type: none"> 1. Identify skills and capabilities that interconnect effectively with the needs of industry. 2. Demonstrate problem solving skills in the context of some real life situation. 3. Reflect and evaluate on future employment opportunities. | |

| | |
|---|--------------|
| Course Title and Code: Discrete Mathematics (CS1141) | |
| Hours per Week | 3-1-0 |
| Credits | 4 |
| Students who can take | B.Tech V Sem |
| Prerequisite | None |
| Weightage | Theory 100 % |
| Course Objectives: This course introduces the students to basic concepts of mathematical logic for analyzing propositions, use sets for solving applied problems, work with relations and investigate their properties, and introduce basic concept of graphs. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Use mathematical terminology and notations to understand the examples in Computer Science. 2. Solve real world problems by applying the knowledge of mathematics 3. Formulate mathematical claims and be able to construct counter examples 4. Learn how to divide a problem, or a proof, into smaller cases. 5. Identify algebraic structures in Computer Science | |

Course Syllabus (Theory):

Unit 1: Set, Relations and Functions - Basic operations on sets, Cartesian products, disjoint union (sum), and power sets. Different types of relations, their compositions and inverses. Different types of functions, their compositions and inverses.

Unit 2: Propositional Logic - Syntax and semantics, proof systems, satisfiability, validity, soundness, completeness, deduction theorem, etc. Decision problems of propositional logic. Introduction to first order logic and first order theory.

Unit 3: Partially Ordered Sets - Complete partial ordering, chain, lattice, complete, distributive, modular and complemented lattices. Boolean and pseudo Boolean lattices.

Unit 4: Algebraic Structures - Algebraic structures with one binary operation – semigroup, monoid and group. Cosets, Lagrange's theorem, normal subgroup, homomorphic subgroup. Congruence relation and quotient structures. Error correcting code. Algebraic structures with two binary operations- ring, integral domain, and field. Boolean algebra and boolean ring (Definitions and simple examples only).

Unit 5: Introduction to Counting - Basic counting techniques – inclusion and exclusion, pigeon-hole principle, permutation, combination, summations. Introduction to recurrence relation and generating functions.

Unit 6: Introduction to Graphs - Graphs and their basic properties – degree, path, cycle, subgraph, isomorphism, Eulerian and Hamiltonian walk, trees.

| Course Title and Code: Computer Networks (CS1111) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech V Sem |
| Prerequisites | None |
| Weightage | Theory 55% Practical 45% |
| <p>Course Objective: This course aims to provide an understanding of the fundamental concepts of computer networking, layers of protocols and network technologies. The course includes computer network organization and implementation, obtaining a theoretical understanding of data communication and computer networks, and gaining practical experience in installation, monitoring, and troubleshooting of current LAN systems.</p> | |
| <p>Course Outcome: On successful completion of this course, the students will be able to:</p> <ol style="list-style-type: none"> 1. Categorize the various type of Networks on the basis of geographical distance, topology and implementation. 2. Implement socket programming to develop networking programs in C. 3. Apply the concepts of IP addressing, subnet masking and routing algorithms to design efficient computer networks 4. Build and deploy applications that use transport protocols like UDP, TCP 5. Analyze distributed systems and classification of agreement protocol. | |

Course Syllabus (Theory)

Unit 1: Introduction, history and development of computer networks, network topologies. Layering and protocols.

Unit 2: Physical Layer: Different types of transmission media, errors in transmission: attenuation, noise. Repeaters. Encoding (NRZ, NRZI, Manchester, 4B/5B, etc.).

Unit 3: MAC Layer: Aloha, CSMA, CSMA/CD, CSMA/CA protocols. Examples: Ethernet, including Gigabit Ethernet and WiFi (802.11).

Unit 4: Data Link Layer: Error detection (Parity, CRC), Sliding Window, Stop and Wait protocols.

Network layer: Internet Protocol, IPv6, ARP, DHCP, ICMP, Routing algorithms: Distance vector, Link state, Metrics, Inter-domain routing. Subnetting, Classless addressing, Network Address Translation.

Unit 5: Transport layer: UDP, TCP. Connection establishment and termination, sliding window revisited, flow and congestion control, timers, retransmission, TCP extensions, etc.

Network Programming: Socket Programming.

Application Layer: File Transfer, DNS, DHCP, etc.

| Course Title and Code: Understanding and Managing Conflict (CC1105) | |
| Hours per Week | L-T-P: 2-0-0 |
| Credits | 2 |
| Students who can take | B.Tech. V Sem |
| Prerequisite | None |
| Weightage | Theory 60%, Practical -40% |
| Course Objective: In today's increasingly complex and fragmented world, it is important to be able to resolve conflicts and build healthy relationships. Interpersonal and group dynamics is a course designed to prepare students to identify conflicts, manage emotions, analyze the situation and characters, and practice different frameworks to deal with conflicts | |
| Learning Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Define a group and explain the stages of group development. 2. Describe conflicts and explain the types and causes of conflict. 3. Use inquiry and advocacy to engage with groups. 4. Give and receive feedback effectively. 5. Identify sources of conflict and manage them using different conflict handling styles. | |

Course Syllabus (Theory):

UNIT I: Group Development and Personality Enhancement: Introduction to the stages of group development. Introduction to the personality, perception and learning as a source of difference in individuals and groups.

UNIT II: Conflict and Conflict Management Strategies: Names and types of conflicts, Intra and Interpersonal conflict, and conflict resolution strategies.

UNIT III: Emotional Intelligence: Development of emotional intelligence. Significance of empathy and feedback in intra and inter-personal development.

UNIT IV: Inquiry and Advocacy: Concept of Silence (Masking, Avoiding, Withdrawing) and Violence (Controlling, Labelling, Attacking).

| Evaluation | Theory 75%, Lab 25% |
| <p>Course Objective: This course discusses the origin and evolution of the field of Artificial Intelligence, failures, successful applications and philosophical foundations. This course will cover state of the art topics in AI as covered in various universities throughout the world. It will cover the basics of uninformed search, A* search and heuristics, constraint satisfaction problems, minimax, expectimax, probabilistic decision making using Hidden Markov Models, Bayes Net, Naïve Bayes, Reinforcement learning.</p> | |
| <p>Learning Outcome: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Identify problems that are amenable to solution by AI methods. 2. Reason about the state-space search algorithm to use under different problem specific conditions. 3. Implement two player games like TicTacToe. 4. Understand use of Markov decision process and reinforcement learning for real-life applications. 5. Design and code solutions to a wide variety of artificial intelligence problems where the machine can learn from the world and act accordingly. | |

Course Syllabus (Theory):

Unit I: Introduction to Artificial Intelligence, History and Philosophy of AI, Intelligent Agents, Classical AI problems, Problem Spaces and Problem Analysis.

Unit II: Solving problems by Searching, Uninformed search (DFS/BFS), Informed Search/Heuristics based search techniques, Generate and test, hill climbing, best first search. Adversarial Search.

Unit III: Graph Pruning, Min-Max Algorithm, Alpha-Beta Pruning. Game Trees. Constraint Satisfaction Problems.

Unit IV: Markov Decision Processes. Introduction to Reinforcement Learning.

Unit V: Knowledge Reasoning and Planning, Logical Agents, First-Order Logic, Inference in First order logic, Knowledge representation, Uncertain knowledge and probabilistic reasoning,

| Course Title and Code: Foundation of Blockchain and Smart Contracts (CS1226) | |
| Hours per Week | L-T-P:2-1-2 |
| Credits | 4 |
| Students who can take | B.Tech(VII +V sem) Department Elective , BCA-V |
| Prerequisite | Database Management System, Any Programming Language |
| Weightage | Theory 60%, Lab 40% |
| Course Objectives: This course aims to provide an understanding of the essential concepts of blockchain technology by initially exploring the Bitcoin protocol followed by the Ethereum protocol to lay the foundation necessary for developing applications and programming for Blockchain Technology. | |
| Learning Outcome: On successful completion of this course, the students should be able to: <ol style="list-style-type: none"> 1. Be able to state core blockchain concepts, the benefits, and the limitations of blockchain technologies. 2. Be able to state the key differentiators for blockchain from other technology systems. 3. Develop, Test and Execute a smart contract. 4. Apply the consensus mechanism on application. 5. Identify use cases and develop the application. 6. Recognize the differences between the most prominent blockchain structures and permissioned blockchain service providers. | |

Course Syllabus (Theory)

Unit -1. Blockchain Overview : History and Origin of Blockchain (and Cryptocurrency) , Blockchain Architecture and design, Technical Concepts of Blockchain Systems : Physical Ledger Technology and Security , Digital Ledger Technology ,Digital Security Technology : Cryptographic Hash Functions ,Digital Signatures, Hash chain to Blockchain, Basic consensus mechanisms: Requirements for the consensus protocols, Proof of Work (PoW), Proof of Concept

Unit -2 DLT Technical Concepts: Mining, Distributed Consensus, Incentives, Proof of Work, Cryptosystems in practice ,Distributed Networks Attacks Introduction to Smart Contracts , Cryptocurrency, Types of Blockchain

Unit -3 The Ethereum ‘Ecosystem’ : Ethereum network, EVM, Transaction fee, Ether, gas, Solidity, Smart contracts, Smart Contract Languages. Solidity, Remix IDE etc.

Unit-4 NFTs and ERC-721 Tokens : Stable Coins and other ERC tokens, DeFi, Crypto exchanges, Cyber Security.

Unit -5 Emerging Applications of Blockchain in industry : Use cases of Blockchain in Agriculture, Bank, Healthcare, Insurance, Science, Supply chain etc. . Comparing Blockchain Ecosystems: Bitcoin, Ethereum, Hyperledger.

| Prerequisites | Database Management Systems |
| Weightage | Theory 45% Lab 55% |
| Course Objective: The student learns about data warehouse systems and implements such a system using Facts and Dimensions. This course also introduces the concepts of distributed databases. Building on this, the architectures of the different NoSQL databases are discussed along with the CRUD operations. | |
| Learning Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Conceptually design data warehouse (DW) system 2. Implement, Extraction Transformation Load (ETL) pipelines for DW on relational data stores 3. Write OnLine Analytical Processing (OLAP) queries DW system 4. Understand the fragmentation strategies of distributed databases 5. Understand the architecture of column and document NoSQL data stores 6. Build conceptual models and query NoSQL databases 7. Implement DW on a column store and document store | |

Course Syllabus (Theory):

Unit 1. **Decision Making and Data Warehousing:** Decision Making; OLTP versus OLAP, Data Warehouse and Data Marts, Data Warehouse Design: Multidimensional Model/ Data Modelling, Hierarchy of Data, Multidimensional Schema, Star Schema, Snowflake Schema, ETL, OLAP operations, OLAP Models

Unit 2. **Introduction to NoSQL Databases:** Evolution of DBs; Data fragmentation strategies. ACID Versus BASE; CAP theorem and its impact; PACLEC theorem and its impact. RDBMS vs NoSQL; Types of NoSQL Databases

Unit 3. **Column Family Databases:** Notion of column; Data Modelling using columns and query first model; CRUD operations of Cassandra; Architecture of Cassandra. **Document Store:** Document and its structure; Data Modeling of Documents, MongoDB architecture, Writing Aggregation Pipeline

Unit 4. **Graph Database:** Types of Graphs: Querying with CypherQL: Key Value Databases: Introduction to Redis, Redis Commands, Querying Data

Unit 5. **Future of warehousing using NoSQL databases,** Data Lakes versus Data Warehouses, Multi Model Database systems

| <p>Course Objectives: This Course is designed to offer learners an introduction to Android platform and related applications in the business world. The course will cover basics and security related issues in app deployment at Google Play Store. Different techniques will be discussed for app design for with real-time and static databases. The course lays the foundation for cross-platform app development course.</p> | |
| <p>Course Outcome: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Develop high-level plans for script solutions for mobile and evaluate the post-production outcome. 2. Design scripts to meet given interface and media control requirements. 3. Use variables, properties and other code elements appropriately. 4. Implement and evaluate techniques for the installation of mobile applications and delivery via various channels. 5. Explain the principles of technologies which support media production and delivery on a variety of platforms. 6. Create event listeners for responding to events. | |

Course Syllabus (Theory)

Module I – Mobile Application Overview

Introduction to Mobile Computing, Introduction to Android development environment, Mobile Software Engineering, Design of application (view level).

Module II – Framework and User Interface Development

Frameworks and tools, Generic UI development, Android user (privileges), Designing the right UI, Multichannel and Multimodal UIs, Android intents and services.

Module III – Storing Retrieving Data with Real-time Database

Synchronization and replication of mobile data, Getting the model Right, Android storing and retrieving Data, Working with a content provider, Communications via network and the web, State Machine, Correct communications Model.

Module IV – Notifications, Alarming and Location

Performance and memory management, Android notifications and alarms, Graphics and UI Performance, Mobile agents and Peer-to-Peer architecture, Mobility and Location Based Services.

| <p>Course Objective: An introduction to VR game development using the Unity3D game engine. This is a project driven course where students will learn the cross-platform game engine Unity3D and develop a series of game projects. Students are expected to demonstrate the techniques taught in class through their projects.</p> | |
| <p>Learning Outcome: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Create multiple gaming applications, utilizing industry-standard tools and software. 2. Introduce them to scientific work in the areas of virtual reality, computer graphics, and artificial intelligence. 3. Gain programming capability to develop games. 4. Apply the mathematics and physics to game design. 5. Practice art creation, music and animations and various tools needed to create assets. 6. Learn to structure and define the duties of the game development team. | |

Course Syllabus (Theory)

Introduction to Unity and Unity Setup, Unity Basics, Using Prefab Objects, Getting Started with AI, Third Person Mechanics, Building a Scene, Unity Interface, Re-arranging different panels such as game window, console window, Project Explorer, Scene window etc.

Creating new layouts, Saving a layout, Understanding 3D Game Objects, Components of Game Objects, Scaling, rotating, zooming and positioning game objects, Learning useful shortcuts, Building a wall using Cubes, Snapping, Unity Scripts, Methods of Mono Behaviour class, Materials, Prefabs, Adding Lights to Game Object, Moving a game object, Rotating and scaling game object using script, Moving game, objects using keys.

Creating a game object at run time, Physics vs Kinematic movements in Unity, PhysX engine, Drag, Collider, Activating / De-activating a game object, Enabling / Disabling game objects, Instantiating Game Objects, Destroying Game Objects.

| Course Title and Code: Digital Image Processing and Introduction to Quantum Computing (EE1224) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech. CSE-V Semester, ECE VI Semester |
| Prerequisites | Calculus and applied mechanics, Computational data analysis |
| Weightage | Theory -60%, Practical and Projects – 40% |
| Course Objectives: The course introduces with the basic principles, techniques, algorithms of image processing and how to use them to solve problems of commercial and scientific interests. Students will be involved in real world project on crop monitoring using quantum computation. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Ascertain and describe the basics of image processing concepts through mathematical interpretation. 2. Acquire the knowledge of various image transforms and image enhancement techniques involved. 3. Demonstrate image restoration process and its respective filters required. 4. Stride convolution filter with different step size, observe the effect of padding and pooling in the image matrix. 5. Represent images into various quantum image formats (Qubit Lattice, Flexible Representation of Quantum Images (FRQI), Realket) and perform geometric/ color transformations. | |

Course Syllabi (Theory):

Unit I: Introduction to Image Processing: Background and Applications, Elements of Visual Perception, Brightness Adaption and Discrimination, Statistical Background, Image representation formats.

Unit II: Image Transforms- Two-dimensional Fourier Transform- Properties – Properties of 2D DFT, Hadamard Transform, Walsh and Discrete Sine/ Cosine Transforms, Walsh Transform, Discrete Cosine Transform, Wavelet Transforms, Wavelet Functions. Transform operations using filters.

Unit III: Convolution, Filters-Mean Filters, Order Static Filters, Strided convolution, Padding Images, Pooling.

Unit IV: Image Processing using Quantum Computing: qubit, logic gates, Quantum circuits, Quantum Fourier Transform, Quantum Image Representation through quantum states, Transformations using quantum circuits.

Textbooks:

| Course Title and Code: IDEA TO BUSINESS MODEL (ED1102) | |
| Hours per Week | L-T-P: 4-0-0 |
| Credits | 4 |
| Students who can take | B.Tech V Semester |
| Pre-requisite | None |
| Weightage | Exam, Presentations, Assignments, Activities and Quiz 80%; Project 20% |
| Course Objective: To encourage students to nurture their entrepreneurial traits and think creatively to develop innovative ideas/products for commercial exploitation. | |
| Course Outcomes: Upon successful completion of the course, the students will be able to: 1. Identify problem worth solving through design thinking. 2. Identify customer segment and niche for specific markets. 3. Craft Value Proposition Canvas. 4. Analyse competition 5. Create business model using Lean Canvas Template 6. Design and validate solution demo and MVP. 7. Analyse cost, revenue, key channels and pricing model for the venture. 8. Craft positioning statement of a new venture. 9. Classify the different sources of funding | |

TOPICS

1. Overview of Entrepreneur and Entrepreneurship
2. Self-Discovery & Entrepreneurial Thinking
3. Opportunity Discovery
4. Identify Customer
5. Value Proposition Canvas
6. Competition Analysis
7. Business Model
8. Minimum Viable Product
9. Money (Revenue, Costs, Pricing and Financing)
10. Marketing and Sales
11. Funding your Venture
12. Support (Institutional and Government policies)
13. Project

| Students who can take | B. Tech and BCA Semester-V Elective |
| Evaluation | Theory – 70%, Lab – 30% |
| Course Objective: This course aims to introduce advanced numerical methods to model engineering systems and to solve them using various computational techniques. Laboratory sessions involve the application of numerical analysis to various physical problems. | |
| Course Outcomes: After course completion, the student will be able to: <ol style="list-style-type: none"> 1. demonstrate an understanding of common numerical methods and used them to obtain approximate solutions to otherwise intractable mathematical problems. 2. develop numerical techniques for different mathematical operations and tasks, such as interpolation, differentiation, integration, the solution of linear and nonlinear equations, and the solution of differential equations. 3. analyze and evaluate the accuracy of common numerical methods. 4. write efficient, well-documented programming code and present numerical results in an informative way. | |

Course Syllabus (Theory)

Modeling, Computers, and Error Analysis: Mathematical Modeling and solution using Programming and Software, Computer Arithmetic and Errors: Approximations and Round-Off Errors, Truncation Errors, and the Taylor Series.

Transcendental and polynomial equations: Solution of non-linear Equations: Bracketing Methods, Open Methods, Roots of polynomials.

Linear Algebraic Equations: LU Decomposition and Matrix Inversion, Iterative methods for solving system of linear equations, finding eigenvalues and eigenvectors.

Interpolation and approximation: Interpolation for equally and unequally spaced points, Lagrangian Polynomial.

Numerical Differentiation and Integration: Numerical Differentiation and Integration, Newton-Cotes Integration Formulae.

Ordinary Differential Equations: Difference equation, Single step methods, Stiffness and Multistep Methods, Predictor-corrector method.

Partial Differential Equations: Finite Difference: Elliptic and Parabolic Equations.

| <p>Course Objective- To familiarize students with concepts of multiple random variables and their properties to use them to analyze real-life problems. This course also focuses on developing an understanding of regression models, data analysis, model building, interpretation of results and statistical computation.</p> | |
| <p>Course Outcome: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. identify, formulate, and derive various properties of probability distributions and density functions of one and more random variables. 2. choose appropriate descriptive properties to summarise a variety of data sets. 3. apply the concepts of the central limit theorem and algebra of random variables to analyze linear systems. 4. analyze a system of multiple random variables using the appropriate regression model. 5. model experiments as processes and analyze them using ANOVA. | |

Course Syllabus (Theory)

Random Variables

Random variables, Distribution and density functions of random variables, Discrete and continuous random variables, Gaussian, Exponential, Rayleigh, Cauchy, Uniform, discrete Uniform and conditional distributions, general properties of distributions.

Multiple Random Variables

Joint and marginal distributions for discrete and continuous random variables. Joint moments, Conditional distributions, correlation coefficient, statistical independence. Multiple random variables, expected value, Variance, standard deviation, moments of multiple random variables.

Operations On Multiple Random Variables

Central limit theorem, Chebyshev's Inequality, covariance, variance of a linear combination of random variables, and distribution of sums of independent random variables.

Regression Analysis

Introduction to the regression model, Types of regression models, Least square estimators, Estimation of the regression coefficients and error variance, Inferences for the regression coefficients, Predicting future observations, Inverse prediction, and regulation. Multiple linear regression models.

Design of Experiments

Analysis of variance, one-way ANOVA, two-way ANOVA, and nonparametric tests.

| | |
|---|---------------------------|
| Course Title and Code: Integrating Design, Technology and Business (IL1211) | |
| Hours per Week | 9 sessions (3 hours each) |
| Credits | 4 |
| Students who can take | B. Tech. V Semester |
| Prerequisite: The course is open to Vth semester students of B.Tech/BBA/B.Des programmes being offered by the University. The course will be restricted to 36 students, with 12 from each discipline (Design, Engineering and Management). As the course will require group working for stretched periods beyond classroom hours, it is highly desirable that participating students stay in hostels during the entire course journey. Students under academic warning/probation are advised to refrain from applying for this course. | |
| Weightage:- Design Conceptualization/Process 30%; New Technology Application 30%; Business Model (BMC) 40% | |
| <p>Course Objectives: Organizations in present times are operating in a highly competitive and an uncertain environment. Innumerable stories exist about products, services and business models that once ruled the market but have now ceased to exist. Many new industry structures, business models, products and services have emerged in the recent past. AirBNB, Uber/Ola, PayTM, Zomato/Swiggy etc. are just a few examples that have transformed the industry structures.</p> <p>Design-led and technology-driven products are becoming the order of the day. Even the startup/entrepreneurial eco-system in the country is increasingly becoming conducive to these developments. All these (and many more) changes need a corporate workforce that has a strong interdisciplinary perspective.</p> <p>Today's designers, technocrats and business managers cannot afford to operate in silos and must effectively collaborate. The present course has been designed and is being offered to meet this very need.</p> <p>It aims to develop future-ready professionals with skills and capabilities that will enable them to collaborate with cross-functional teams and inter-disciplinary forces while they identify business problems/opportunities from the real-world and design and develop technology-driven marketable solutions to solve the identified problems/tap the business opportunities.</p> <p>The present course would be offered as a project-based learning opportunity to the students of B.Tech, BBA, and B.Des students at the University. The focus of the course would be to identify a real-world business problem/opportunity, develop proposed solution to solve/tap it using contemporary technologies and prepare a business plan to commercialize it. Groups of students from all the three disciplines shall be working together at every stage of the course and producing their proposed plan.</p> <p>To make it a little specific, the context for the current cohort will be Healthcare Sector while the target technologies will broadly be AI/ML, IoT (Internet of Things), Blockchain and AR/VR. The course will involve classroom interactions with experts in the technology, design, and management domain. There will also be expert sessions from the healthcare sector for facilitating the identification of challenges and opportunities in the same.</p> <p>Through these interactions and collaborative working, students will learn about the development of modern technology applications using design principles and prepare a business plan that is ready for commercialization. The course will also provide an opportunity for the students to learn how to meaningfully engage themselves in an intelligent discussion with members across diverse functions.</p> | |

Detailed Session Plan

The course will be delivered over nine weeks during Aug-Oct'23. There will be one session of three hours every week. During these sessions, the students will be exposed to the concepts relating to recent technology applications, business models, and strategic design management.

The sessions will involve lectures by domain experts, invited talks by experts, classroom/lab exercises besides having a mix of several other pedagogical tools. Besides these sessions, students will be required to work with

their respective group members on the key takeaway tasks/assignments and achieve the weekly milestones as indicated in the session schedule. An indicative schedule is presented herewith which may be fine-tuned depending upon the progress of the groups and availability of experts.

| Week/Session | Focus Area/Broad Topics | Milestones/Remarks |
|---------------------|--|---------------------------|
| W1/S1 | <u>Technology</u> Introducing the Context and Technology Domain | |
| W2/S2 | <u>Design Thinking & Process</u> Preliminary Investigation for identifying opportunities using Design principles | |
| W3 | <u>Field Work</u> Identification of real-world problems worth solving | |
| W4/S3 | <u>Design & Technology</u> Discussion & Evaluation of alternative applications | |
| W5 | <u>Field Work</u> Narrowing down the solution space | |
| W6/S4 | <u>Business</u> Use Business Model Canvas to identify business issues | |
| W7-W8 | Sessions in Workshop mode on business plan and prototype development | |
| W9 | Final Submissions and Presentation | |

| Prerequisite | Computer Organization and Architecture, Computational Data Analysis |
| Weightage | Theory -40%, Practical– 60% |
| Course Objective- | |
| The course aims to introduce Internet of Things (IoT) technologies for developing different applications. It focusses to develop skills for designing, implementing and testing solutions for automation using IoT. | |
| Course Outcome: | |
| On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Recommend sensor and networking technologies for an IoT application. 2. Explore various protocols and data conversion process using various IoT devices. 3. Use cloud servers for data streaming and analysis. 4. Design and implement a complete project in IoT/Automation using microcontroller/SOC interfaced with sensors or any other automation hardware/tools, 5. Deploy techniques to conserve bandwidth/energy/other resources and achieve cost economy for project. | |

Course Syllabus (Theory):

UNIT I Definition and Characteristics of Internet of Things (IoT) - - Physical Design of IoT - Logical Design of IoT - IoT Functional Blocks, network configuration, emerging technologies for IoT: RFID, Wireless Sensor Networks.

UNIT II: Physical parameters, Measurement principles, Calibration, Amplification, Mechanical and Electrical Actuators, Closed loop systems for automation.

UNIT III – Communication modules – Bluetooth – Zigbee – WiFi – GPS - IoT Protocols (IPv6, 6LoWPAN, RPL, CoAP) – MQTT - Wired Communication (Serial, I2C and SPI) - Power Sources.

UNIT IV: IoT Endpoints: ARM architecture, Raspberry pi, ESP8266 firmware, Interfacing sensors to edge endpoints. Uploading data to cloud for visualization and analysis.

Textbooks:

1. Arshdeep Bahga and Vijay Madisetti Internet of Things: A Hands-on Approach, Universities Press.

| Course Title and Course Code: Computational Game Theory and Applications (EE1223) | |
| Hours per Week | L T P: 3 1 0 |
| Credits | 4 |
| Students who can take | BTech Semester-V |
| Prerequisite | Calculus, Probability and Statistics, Mathematical Modeling, Knowledge of computer programming |
| Weightage | Theory - 60%, Project, Quiz, Viva, and Assignments – 40% |

Course Objective:

The course focuses on areas of game theory that are relevant for engineering applications. The emphasis is both on theoretical principles and on the application of the theory to problem formulation and problem solving. The course covers a wide range of topics, from different models of non-cooperative games and related equilibrium concepts to cooperative games.

Course Outcomes:

On successful completion of this course, the students will be able to:

1. Explain the key concepts of preferences, utility, and decision-making under certainty and uncertainty.
2. Apply the key models and solution concepts of non-cooperative game theory, including both strategic form and extensive form games.
3. Evaluate the importance of competitive and cooperative factors in a variety of decision problems.
4. Analyse the key models and solution concepts of cooperative game theory, including TU and NTU games.
5. Analyze games with imperfect and incomplete information.

Course Syllabus :

Unit-1: Introduction

Introduction to game theory, routing games and mechanism design; Strategies, costs, and payoffs; Prisoner's dilemma, Nash Equilibrium, Strategic games; Best response; Dominant strategies; Pure strategy v/s Mixed strategy.

Unit-2: Preferences, Utility, and Goals

Preference relations and their interpretation, utility as a numeric model of preference, Decision-making under uncertainty: preferences over lotteries; Von Neumann and Morgenstern utility functions; expected utility and expected utility maximisation, Paradoxes of expected utility maximization; framing effects and prospect theory.

Unit-3: Bayesian Games

Definition of a Bayesian Game and Bayesian Nash Equilibrium, Games with incomplete information, Bayesian-Nash equilibrium, Perfect Bayesian equilibrium, Refinements of PBE, Applications to spence job-market signaling game, oligopoly games with asymmetric information etc.

Unit-4: Cooperative and Non-Cooperative Games

Noncooperative Game Theory: Strategic form games, existence of Nash equilibrium, computation of Nash equilibrium, matrix games, minimax theorem, extensive form games.

Cooperative Game Theory: Correlated equilibrium, two person bargaining problem, coalitional games, core, shapley value and its implications, Transferable utility (TU) and nontransferable utility (NTU) games.

Unit-5: Engineering Applications

Game theory based control approach for smart grid operation, power control schemes, reactive power management, demand side management, electric vehicle charging, storage management, electricity pricing etc.

| Course Title and Code: Virtual Reality Lab (CS1221) | |
| Hours per Week | L-T-P: 0-0-4 |
| Credits | 2 |
| Students who can take | B.Tech. CSE Semester V |
| Prerequisite | None |
| Weightage | Practical 100% |
| Course Objective: This course presents an introduction to virtual reality technologies, with an emphasis on designing and developing interactive virtual reality experiences. The course will cover 3-D modelling, interaction techniques, and specific application areas. Students will be able to work on real-life projects using VR technology. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Understand how the design of VR technology relates to human perception and cognition. 2. Apply the acquired knowledge for the analysis and design of VR systems. 3. Apply and use several types of Hardware and software in Virtual Reality systems. 4. Gain first-hand experience with using virtual environment technology, including 3D rendering software, tracking hardware, and input/output functions for capturing user data. 5. Develop and deploy VR (Virtual Reality) applications using Blender and Unity/ Unreal tools. | |

Course Syllabus (Theory):

Hands-on Modeling using Blender

- Overview
- Start Modeling
- Installing Blender
- Blender: Essential Training
- Blender: Essential Concepts Summary
- Optimization and Rendering
- Create interactive 3D models
-

Introduction to Virtual Environment Technology

- VR and its relation to humans
- The relation of VR to research, training, design, and manufacturing.
- An overview of VR applications.
- VR design: perceptual and cognitive factors.

Introduction to Unity/Unreal Engine:

- Interface overview and navigation
- Creating a new project, importing standard assets, adding a player character
- Tracking, Latency, Field of View in Real life,
- Fidelity, depth, isolation, smell, range of motion (DoF)
- Sensory Influence: Kinetics, Spatial Audio, Haptics, Other senses?
- Megascans plugin for Unity/Unreal

Note - Tools recommended: - Blender, Unity/Unreal

FINAL PROJECT: Building one VR Application.

| Course Title and Code: Geographical Information Systems Lab (GIS) (CE1114) | |
| Hours per Week | L-T-P: 0-0-4 |
| Credits | 2 |
| Students who can take | B.Tech V sem (B Tech CSE, EEE and ME) |
| Prerequisite | None |
| Weightage | Practical 100% |
| Course Objective: This course presents an introduction to virtual reality technologies, with an emphasis on designing and developing interactive virtual reality experiences. The course will cover 3-D modelling, interaction techniques, and specific application areas. Students will be able to work on real-life projects using VR technology. | |
| Course Outcomes: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1 Assess the various sources for remote sensing data and analyze the various type of images. 2 Analyze the data acquisition and data output through GIS, with the help of open-source tool of QGIS and Python. 3 Automate GIS processes with Python-based plugin development for QGIS. 4 Incorporate GIS in resource management and climate change applications | |

Course Syllabus

- Remote sensing satellites and their data products, Sensors and orbital characteristics, Satellite Image - Characteristics and formats, Introduction to Image rectification, Image Enhancement, Land use and land cover classification system.
- Basic concepts of geographic data, GIS and its components, Data acquisition, Raster and Vector formats, Topology and Data models, Spatial modeling, Data output
- Applications of GIS: Climate change, Natural resources management, Forest management, Water Resources management, Drought Management, Location-based services.

Syllabus (Practical with QGIS and Python)

QGIS experiments

1. Creating and Exploring a Basic Map
2. Classifying and Creating Vector Data
3. Laying Out of the Maps
4. Classifying and Creating Raster Data
5. Terrain Analysis
6. Raster to Vector Conversion
7. Hydrologic Analysis

Python-based experiments

1. Working with Shapely package and geometric objects
2. Vector data analysis with Geopandas
3. Geocoding in Geopandas
4. Analyzing raster data and automatically detecting features
5. Working with Maps
6. Plugin development and integration with QGIS

|---|--------------------------------|
| Course Title and Code: Robotic Process Automation Lab (CS1125) | |
| Hours per Week | L-T-P: 0-0-4 |
| Credits | 2 |
| Students who can take | BTech (CSE, ECE, CE, ME) Sem V |
| Prerequisite | Any Programming Language |
| Weightage | Quiz 20% Practical 80% |
| Course Objective- The course aim is to develop an understanding of Intelligent Automation through Robotic Process Automation for automating business processes using software robots with cost-efficient digital delivery. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Use and understand the various functionalities and features of UiPath Studio and Orchestrator. 2. Design, implement, and use RPA activities. 3. Develop basic robots using UiPath Community Edition. 4. Explore various data extraction techniques. 5. Identify processes which can be automated. 6. Develop business BOTs using Automation Anywhere (360). 7. Apply best practices in RPA projects. | |

Course Syllabus (Theory):

Unit I: Programming Basic & Recap: Programming concept basic; **Introduction to RPA:** scopes and techniques of automation, RPA components and various RPA platforms, Introduction to UiPath as RPA platform, Applications and Benefits of RPA, Introduction to UiPath Studio, UiPath robot, types of robots, and UiPath Orchestrator. Brief on Studio interface and components.

Unit II: **RPA Projects:** Types of Projects in RPA: Sequence, Flowcharts, and State machines; Variables, Arguments, Data Types and Control flow: flow chart activities and sequences activities. **Data Manipulation:** Text and Data Manipulation, Data tables, clipboard management, file operation, importing from and exporting to CSV/Excel file and data table.

Unit III: **Control of Controls:** Attach window activity, Find and wait for the control, Introduction to Recorder, OCR, types of OCR and Screen Scrapping Using OCR. **Selectors:** Selectors, Defining and Assessing Selectors, Customization, Debugging, Dynamic Selectors, Partial Selectors, RPA Challenge.

Unit IV: **Application with Plugins and Extensions:** Mail plugins, PDF plugins, Web integration, excel and word plugins. Extensions- Java, chrome and firefox. **UiPath Advanced Automation concepts and techniques:** Image, Text and introduction of Citrix Automation; **Excel Data Tables & PDF:** Data Tables in RPA, Excel and Data Table basics, Data Manipulation in excel, Extracting Data from PDF, Extracting a single piece of data, Anchors. **Email Automation:** Incoming Email automation, Sending Email automation.

Unit V: **Automation Anywhere (AA):** Overview and Installation of Automation Anywhere Community Edition; Configuration of profile and device credentials; AA Architecture, Flow, List, and Dual Views of projects, Variables and Triggers; and Capstone Projects.

|--|---------------------|
| Course Title and Code: Google Cloud Lab (CS1223) | |
| Hours per Week | L-T-P: 0-0-4 |
| Credits | 2 |
| Students who can take | B.Tech. V Sem |
| Prerequisite | None |
| Weightage | Practical 100% |
| Course Objective: This course aims to provide hands-on training on Google cloud. The students will learn the Infrastructure and services provided by Google cloud based on well-known practices. | |
| Learning Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Create and deploy resilient, elastic, cost-effective cloud applications on Google Cloud. 2. Examine the trade-offs between deploying applications in Google Cloud and over the local Infrastructure. 3. Deploy applications over commercial cloud computing infrastructures, i.e., Google Cloud. 4. Evaluate the performance, scalability, and availability of the underlying cloud 5. technologies and software. | |

Course Contents:

Getting Started with Compute Engine, Getting Started with Cloud Marketplace, Getting Started with Cloud Storage and Cloud SQL, Getting Started with GKE, Getting Started with App Engine, Getting Started with Deployment Manager and Cloud Monitoring

Getting Started with BigQuery, Working with the Cloud Console and Cloud Shell, Infrastructure Preview, VPC Networking. Implement Private Google Access and Cloud NAT

Creating virtual machines, Working with Virtual Machines, Cloud IAM, Cloud Storage, Implementing Cloud SQL, Examining Billing Data with BigQuery, Resource Monitoring, Error Reporting, and Debugging

Virtual Private Networks (VPN), Configuring an HTTP Load Balancer with Autoscaling, Configuring an Internal Load Balancer, Automating the Infrastructure of networks using Terraform, Building a DevOps Pipeline, Deploying Apps to Google Cloud, Monitoring Applications in Google Cloud

Text Books:

| | |
|--|---|
| Course Title and Code: Theory of Computation (CS1140) | |
| Hours per Week | L-T-P: 3-1-0 |
| Credits | 4 |
| Students who can take | B.Tech. VI Sem |
| Prerequisites | Discrete Mathematics; C Programming and Data Structures |
| Weightage | Theory 100% |
| Course Objective: This course examines formal models of automata and languages. Finite-state automata, regular languages, pushdown automata, context-free languages, Turing machines, decidability, reducibility, and P vs NP complexity classes are covered in detail in this course | |
| Learning Outcome: | |
| <ol style="list-style-type: none"> 1. Understand models and abstractions: automata as a basic model of computation 2. Link between languages, automata, and decision problems. 3. How to build new models from old ones: product, union, closure properties. 4. Argue about limitations of computational models. 5. Understand algebraic formalisms of languages such as regular expressions, context-free grammar. 6. Understand algorithms and computability through the lens of Turing machines. 7. Existence of unsolvable problems and what that means. 8. Relations between the various computational models | |

Course Syllabus (Theory)

Unit I: Automata: Introduction to formal proof, Additional forms of proof, Inductive proofs, Finite Automata (FA), Deterministic Finite Automata (DFA), Non-deterministic Finite Automata (NFA), Finite Automata with Epsilon transitions.

Unit II: Regular Expressions and Languages: Regular Expression, FA and Regular Expressions, proving languages not to be regular, Closure properties of regular languages, Equivalence and minimization of Automata.

Unit III: Context-Free Grammars and Languages: Context-Free Grammar (CFG), Parse Trees, Ambiguity in grammars and languages, Definition of the Pushdown automata, Languages of a Pushdown Automata, Equivalence of Pushdown automata and CFG Deterministic Pushdown Automata.

Unit IV: Properties of Context-Free Languages: Normal forms for CFG, Pumping Lemma for CFL, Closure Properties of CFL, Turing Machines, Programming Techniques for TM, Variations of TM, Non-Universal TM, Universal TM.

Unit V: Undecidability: A language that is not Recursively Enumerable (RE), An undecidable problem that is RE Undecidable problems about Turing Machine, Post's Correspondence Problem, The classes P and NP.

|---|-------------------------|
| Course Title and Code: Minor Project PR1103 | |
| Credits | 2 |
| Students who can take | B.Tech Sem VI |
| Prerequisites | None |
| Weightage | Report and Project 100% |
| <p>Course Objective- This course offers an opportunity to apply and extend knowledge learned throughout the program to solve real world issues. The minor projects undertaken span a diverse range of topics, including design, simulation, and experimental studies. The course emphasizes, facilitating student learning in technical, project implementation and presentation spheres.</p> | |
| <p>Course Outcome:</p> <p>On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Identify and formulate industrial and societal problems. 2. Design engineering solutions for complex problems. 3. Develop/fabricate, and implement solutions for identified problem. 4. Demonstrate the knowledge, skills and attitudes of a professional engineer. | |

| | |
|---|--------------------------|
| Course Title and Code: Critical Thinking for Decisions at Workplace; CC1106 | |
| Hours per Week | L-T-P: 2-0-0 |
| Credits | 2 |
| Students who can take | BTech Semester VI |
| Prerequisite | None |
| Weightage | Theory 40% Practical 60% |
| Course Objective- In today's world, the idea of right and wrong is being challenged by businesses, use of technology, economic conditions, and norms of societies. The relevance of a well-reasoned decision is crucial. This course intends to make students take better decisions keeping in mind purpose, context, and ethics. | |
| Course Outcomes: The students will be able to: | |
| <ol style="list-style-type: none"> 1. Apply strategies of Critical Thinking to examine organisational problems through positive inquiry 2. Describe and examine suitable problem-solving and ethical decision-making processes 3. Choose the simplest and logical decision among multiple alternatives 4. Evaluate solutions and count on possible risks based on purpose, context and ethics | |

Course Syllabus:

| |
|---|
| Topics |
| <ul style="list-style-type: none"> • Importance of decision making at workplace • Robust decision making by David G Ullman • Taxonomy of decision making by Rowe and Boulgarides • Factors impacting decision-making • Concept of enquiry circle • Theories of ethics (Teleological, Deontological, Virtue Ethics, Conduct Ethics, Rights based, Utilitarianism, Hedonism, Egoism) • Concept of moral development by Kohlberg • Role of ethics and values in decision Making • Role of Stakeholders in decision making. • Root cause analysis |

| Students who can take | B. Tech. VI Semester |
| Prerequisite | Machine Learning |
| Weightage | Theory 60% Practical 40% |
| <p>Course Objective: This course covers the most successful form of artificial intelligence, deep learning. We will be covering linear regression, logistic regression, deep neural networks, convolutional and recurrent neural networks. The course will also focus on optimization techniques like gradient descent and its variants. Programming will be an important component of the course. We will be using Python as our primary language. For implementation of algorithms, we will be using Tensorflow and Keras.</p> | |
| <p>Course Outcomes: On successful completion of this course, the students will be able to:</p> <ol style="list-style-type: none"> 1 Prioritize the collection and usefulness of data for a particular deep learning task. 2 Apply theory and implementation learned in the course to real world problems on computer vision and natural language processing. 3 Judge whether a particular problem can be solved using deep learning or not. 4 Critically analyze which architecture to use for a specific problem. 5 Design and implement deep learning algorithms using Tensorflow and Keras framework. | |

Course Syllabus (Theory)

UNIT – I Introduction

Linear and logistic regression. Cost function for logistic regression.

UNIT – II Deep Neural Networks

Generalization of logistic regression to deep neural networks. Cost functions. Optimization algorithms: Gradient descent, Stochastic gradient descent, Momentum, RMSprop, Adam.

UNIT – III Regularization Techniques

Underfitting and overfitting of neural networks: bias and variance. L1, L2 and dropout regularization techniques, hyperparameter tuning.

UNIT – IV Deep Learning for Computer Vision

Basics of CNN: convolutions and pooling. Detailed understanding of Alexnet, ResNet, VGG-16, VGG-19 and inception architectures. Their implementations. Object recognition and face recognition.

UNIT – V Deep Learning for Natural Language Processing

Basics of RNN, LSTM, GRU, Bidirectional RNN, deep RNNs. Representations of words as vectors. One hot encoding and word embeddings. Learning word embeddings using word2vec, GloVe. Transformers.

| Course Title and Code: Big Data Engineering (CS1312) | |
| Hours per Week | L-T-P: 2-0-4 |
| Credits | 4 |
| Students who can take | B.Tech CSE Sem VI/BCA Sem VI |
| Prerequisite | Operating System, Database Management System |
| Weightage | Theory 20% Practical 80% |
| Course Objective- The main goal of this course is to help students learn, understand, and practice modern big data technologies for scaling up data science techniques focusing on industry applications. This course builds upon the foundations laid on operating system, databases, and machine learning. | |
| Course Outcomes: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Identify the characteristics of datasets and compare the trivial data and big data for various applications. 2. Develop Big Data Solutions using Hadoop Eco System 3. Select and implement machine learning techniques and computing environment that are suitable for the applications under consideration. 4. Integrate Data Science libraries in Python with big data technologies. 5. Utilize big data technologies for data analysis. | |

Course Syllabus (Theory):

Introduction to Big Data and Hadoop

Data Overview, Industry Applications, Case Studies, Understanding Big Data; Hadoop overview: Hadoop Introduction, Hadoop architecture, HDFS Introduction, HDFS architecture, MapReduce v 1.0 and YARN differences and their architecture, Hadoop Security, Hortonworks Data Platform (HDP)

Hadoop Eco System

Pig: Introduction to PIG, Execution Modes of Pig, Comparison of Pig with Databases, Grunt, Pig Latin, User Defined Functions, Data Processing operators.

Hive: Hive Shell, Hive Services, Hive Metastore, Comparison with Traditional Databases, HiveQL, Tables, Querying Data and User Defined Functions.

Hbase: HBasics, Concepts, Clients, Example, Hbase Versus RDBMS.

Sqoop: Sqoop commands

Big Data Analytics

Introduction to Big Data Analytics, Descriptive analytics, Data-driven Decision Making, Web scraping and data acquisition, Data Pre-processing, Data visualization, Model Development, Model Validation, Model Diagnostics, Model Deployment, Regression, Classification and Clustering methods, Dimensionality reduction, Network analysis, Ethics of big data

| Course Title and Code: Full Stack Web Development with REACT (CS1212) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech. CSE VI |
| Prerequisites | Any Programming language, Database Management Systems |
| Weightage | Theory 30% Practical 70% |
| <p>Course Objective: This course will equip the students with understanding and skills for MERN stack web development using MongoDB database, NodeJS, Express and React library.</p> <p>Course Outcomes: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Develop high-level plans for script solutions for web to evaluate the post-production outcome. 2. Implement front end web design in ReactJs. 3. Design scripts to meet given interface and media control requirements. 4. Devise, carry out and evaluate functional test strategies of web design. 5. Implement and evaluate techniques for the installation of cross platform mobile applications and delivery via various channels. 6. Implement NoSQL databases using MongoDB, work within a Node.js environment and Express framework. 7. Communicate to the client side through a RESTful API and web services. | |

Course Syllabus (Theory):

JavaScript application development and the React library, React Router and Single Page Applications, Reactstrap, React Native UI Elements and Redux.

React Native Alerts, Animations, Gestures, and Persist Redux Store, Accessing Native Capabilities of Devices: The Expo SDK

Front-end Web UI Frameworks Overview: Bootstrap, Bootstrap CSS Components, Bootstrap JavaScript Components

Web Tools - Bootstrap JavaScript, CSS preprocessors, Less and Sass, automation using NPM scripts, and task runners like Grunt and Gulp.

Introduction to Server-side Development - Node, Node modules and the Node HTTP server, Express framework and set up a REST API using Express.

Data storage with MongoDB, the popular NoSQL database, Express generator, interaction with MongoDB from a Node application, REST API server with Express, Mongo and Mongoose, Mongoose population, secure communication using HTTPS.

Text Books:

1. Fullstack React Native: Create beautiful mobile apps with JavaScript and React Native
2. Learning React: Functional Web Development with React and Redux
3. Practical React Native: Build Two Full Projects and One Full Game using React Native

|---|---|
| Course Title and Code: Cloud Computing Architecture (CS1217) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech. CSE Sem VI |
| Prerequisites | Operating Systems, Computer Networks, Database Management Systems, Computer Organisation and Architecture |
| Weightage | Theory 40% Practical 60% |
| Course Objective: | |
| The course presents a top-down view of cloud computing, from applications and administration to programming and infrastructure. The main focus is on deployment of solution elements, including infrastructure components such as networks, systems and applications services in the cloud infrastructure. This course builds upon the Operating System, Computer Networks, Database, Computer Architecture. | |
| Course Outcomes: | |
| On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Apply fundamental concepts in cloud infrastructures to understand the trade-offs in power, efficiency and cost 2. Build and deploy cloud applications that are resilient, elastic and cost-efficient 3. Analyse the trade-offs between deploying applications in the cloud and over the local infrastructure. 4. Deploy applications over commercial cloud computing infrastructures, i.e., Google Cloud 5. Analyse the performance, scalability, and availability of the underlying cloud technologies and software | |

Course Syllabus (Theory):

Cloud Computing Overview: Definition and evolution of Cloud Computing, Enabling Technologies, Service and Deployment Models, Popular Cloud Stacks and Use Cases, Benefits, Risks, and Challenges of Cloud Computing, Economic Models and SLAs, Topics in Cloud Security

Cloud Infrastructure: Historical Perspective of Data Centres, Datacentre Components: IT Equipment and Facilities, Design Considerations: Requirements, Power, Efficiency, & Redundancy, Power Calculations, PUE and Challenges in Cloud Data Centres, Cloud Management and Cloud Software Deployment Considerations

Google Cloud Platform Fundamentals: Google App Engine, Google Compute Engine, Google Kubernetes Engine, Google Cloud Storage, Google Cloud SQL, and BigQuery, Google Cloud Resource Manager hierarchy and Google Cloud Identity and Access Management, infrastructure design, and virtual networking configuration with Virtual Private Cloud (VPC), Projects, Networks, Subnetworks, IP addresses, Routes, and Firewall rules

Google Cloud Infrastructure: Compute Engine, Core Services, customer-supplied encryption keys, security and access management, quotas and billing, and resource monitoring, Scaling and Automation, securely interconnecting networks, load balancing, auto-scaling, infrastructure automation and managed services, Design and Process, define and balance business and technical requirements to design Google Cloud deployments, Kubernetes Engine, Creating and managing software containers and an introduction to the architecture of Kubernetes.

Cloud Computing Standards- Introduction- Objectives, Best Practices and Standards, Practical Issues- Interoperability- Portability- Integration- Security

| Course Title and Code: Software Engineering (CS1113) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech Sem VI |
| Prerequisites | Object Oriented Programming |
| Weightage | Theory 50% Practical 50% |
| Course Objective: In this course, students will gain a broad understanding of the discipline of software engineering and apply theories, models, and techniques to solve real-world problems. | |
| Course Outcomes: On successful completion of this course, the students will be able to: | |
| <ol style="list-style-type: none"> 1. Use software development lifecycle models for project development. 2. Design solutions in various application domains using software engineering approaches that integrate ethical and economic concerns. 3. Elicit and evaluate functional and non-functional requirements for a software system. 4. Design, represent and document software requirements specifications according to IEEE standards. 5. Apply UML modeling for software design. 6. Apply coding standards and guidelines. 7. Prepare code checklist and perform code inspections, code reviews and walkthrough. 8. Develop and implement various manual and automated testing procedures. 9. Estimate the cost of the software project. 10. Evaluate software in terms of software quality and quality assurance according to ISO standards. | |

Course Syllabus (Theory)

UNIT I: Basics, Software Engineering, Software Components, Software Characteristics, Software Crisis, Software Engineering Processes, Software Development Life Cycle (SDLC) Models: Waterfall Model, Iterative waterfall model, Incremental Process Model, Evolutionary Development Models, Specialized Process Model, V-Model, An Agile view of the process, Agile process models namely Extreme Programming (XP), Adaptive software development (ASD), Scrum and Crystal.

UNIT II: Requirement Engineering Process: Elicitation, Analysis, Documentation, Review and Management of User Needs, Feasibility Study, Information Modeling, Data Flow Diagrams, Entity Relationship Diagrams, Decision Tables, SRS Document, IEEE Standards for SRS.

UNIT III: Basic Concept of Software Design, Architectural Design, Low-Level Design, Modularization, Design Structure Charts, Pseudo Codes, Flow Charts, Coupling and Cohesion Measures, Design methods and Strategies: Function Oriented Design, Object Oriented Design, Top-Down and Bottom-Up Design.

UNIT IV: Coding and Software Testing: Coding standards, programming style, code inspection, code review and walkthrough; Testing Objectives, Unit Testing, Integration Testing, Acceptance Testing, Regression Testing, Testing for Functionality and Testing for Performance, Top-down and Bottom-up, Testing Strategies, Test Drivers and Test Stubs, Structural Testing (White Box Testing), Functional Testing (Black Box Testing), Test Data Suit Preparation, Alpha and Beta Testing of Products.

UNIT V: Software Measures, Metrics and Models: Various Size Oriented Measures, Hallstead's Software Science, Function Point (FP) Based Measures, Cyclomatic Complexity Measures, Control Flow Graphs, Software metrics classification, Cost estimation models, Estimation of Various Parameters such as Cost, Efforts, Schedule/Duration, Constructive Cost Models (COCOMO); Software quality and quality assurance, ISO standards; Software Re-engineering, Reverse engineering and Software Configuration.

| Course Outcomes: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Specify and analyze the lexical, syntactic and semantic structures of programming language features 2. Separate the lexical, syntactic and semantic analysis into meaningful phases for a compiler to undertake language translation 3. Write scanners, parsers, and semantic analyzers without the aid of automatic generators 4. Utilize the compiler design concept to write efficient programs 5. Design the structures and support required for compiling advanced language features. | |

Course Syllabus (Theory)

UNIT I: Introduction, Lexical analysis: Language processor, compiler, structure of a compiler, applications of Compiler technology, interpreter, cousins of a compiler, introduction to one pass & multipass compilers, Bootstrapping, Review of finite automata, Lexical analyzer, input buffering, Recognition of tokens, Lex: A lexical analyzer generator, Error handling

UNIT II: Syntax analysis: Review of context-free grammars (CFGs), Ambiguity of grammars, Taxonomy for parsing techniques, Top down parsing techniques: non-predictive or backtracking, recursive descent and non-recursive (LL) predictive parsing, bottom up (Shift reduce) parsing techniques: operator precedence parsing, LR (SLR, CLR and LALR) parsers, parsing with ambiguous grammar

UNIT III: Syntax directed definition and Intermediate Code Generation: Syntax-Directed definitions (SDDs): Evaluation order for SDDs; Applications of Syntax-directed translation; Syntax-directed translation schemes, Intermediate code generation: Variants of syntax trees; Three-address code; Types and declarations; Translation of expressions; Type checking; Control flow; Back patching; Switch statements; Intermediate code for procedures.

UNIT IV: Run time environments: Storage organization, Stack allocation of space, Access to non-local data on the stack, symbol table organization, Data structures used in symbol tables

UNIT V: Code generation: Basic blocks and Flow graphs, DAG (Directed Acyclic Graph) representation of basic block, Optimization of basic blocks, Issues in design of code generator, The Target language; Addresses in the target code, A simple code generator, Code generation from a DAG

| | |
|---|--|
| Course Title and Code: Cryptography (CS1214) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech. Sem VI |
| Prerequisites | Computational Data Analysis, C Programming and Data Structures |
| Weightage | Theory 40% Practical 60% |
| Course Objective- | |
| In this course student will understand cryptographic algorithms and their applications. Throughout the course, students will be exposed to many exciting open problems in the field and work on programming projects. This course will help students to explore security aspects of various future courses like, Network Security, Mobile Application Developments and Cloud Computing. | |
| Course Outcomes: | |
| On successful completion of this course, the students will be able to | |
| 1. Explain the concept of Cryptography | |
| 2. Realize the complexities of Cryptographic Attacks | |
| 3. Apply the Public-Key Cryptography | |
| 4. Learn Symmetric-Key Algorithm | |
| 5. Use the techniques of Digital Signatures in their projects | |
| 6. Demonstrate the Secure Protocols | |

Course Syllabus(Theory)

- Overview of cryptography. What is a cipher?
- Basic symmetric-key encryption, Stream ciphers, one time pad, Block ciphers, AES and DES. Pseudo Random Permutations (PRP); Pseudo Random Functions (PRF); Chosen plaintext attacks (CPA)
- Message integrity: CBC-MAC and PMAC, Collision resistant hashing, Merkle-Damgard and Davies-Meyer. MACs from collision resistance, SHA and HMAC, Active attacks
- Public key cryptography: Arithmetic modulo primes, Vanilla key exchange (Diffie-Hellman), Public key encryption, ElGamal encryption, RSA and Rabin functions, Trapdoor permutations
- Digital signatures: Signature using RSA, Hash based signatures, certificates, certificate transparency, certificate revocation.
- Protocols: Identification protocols, Password protocols, salts; one-time passwords, challenge response authentication, Zero knowledge proof
- Cryptography in the age of quantum computers, Grover's algorithm and Shor's algorithm

Text Books:

1. Introduction to Modern Cryptography, Katz and Lindell, 3rd Edition.
2. Free book of Cryptography, Dan Boneh and Victor Soup

Reference Courses:

| Course Title and Code: Cyber Security (EE1219) | |
| Hours per Week | L-T-P: 2-1-2 |
| Credits | 4 |
| Students who can take | B. Tech. VI Semester |
| Prerequisite: None | |
| Weightage: Theory -70%, Practical and Projects – 30% | |
| Course Objectives: This course introduces the NIST Cybersecurity framework and sensitizes the students on security risks, malware and social engineering attacks. It builds skills for ensuring good cyber hygiene, monitoring and reporting cyber-attacks for an online computer. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1. Recommend the implementation tier for the NIST framework for a specific organization. 2. Detect malicious attempts in a network using network sniffers 3. Carry out stages of forensic investigation by taking memory backups, data recovery, analyzing registry, traffic logs etc. 4. Perform ethical hacking on virtual boxes and understand how hackers work. 5. Use automation tools for threat intelligence perception. | |

Course Syllabus (Theory):

Unit 1: Introduction to NIST framework, Organization functions, CyberSeek, Types of Cyber Attacks, Vulnerabilities, Risks and Exploits, Overview of zero trust.

Unit 2 Network and Application Security- What is network security, Revision on Principals of Cryptography, Message Integrity, Digital Signatures, End point Authentication, Securing Email, Securing TCP connection, Securing Wireless LAN.

Intrusion Detection systems (IDS), Intrusion Prevention systems (IPS), Security Information and Event Management (SIEM) log analysis- using Splunk, Snort, Demilitarized zones (DMZ), Honeypots in network. Monitoring cyberattacks using SIEM for DOS, SQLi, XXS, XXE, LFi, Command Injection, identifying False Positive and False Negatives in SIEM logs.

Unit 3- Forensic - Introduction, Benefits and Challenges of Digital Forensic, Methodology, setting up Forensic workstation, NIST catalog for searching forensic tools and techniques, Computer, Registry, Mobile forensic tools, difference between Digital and Electronic Forensic, Hands-on using tools-Autopsy, Scalpel and Binwalk for data carving, extracting Botnet from memory, RAM triage., Network Miner and Wireshark for traffic analysis, Registry acquisition using FTK Imager, Shellbag explorer ,Registry viewer. Anti-forensic methods.

Unit 4 Ethical Hacking -White hat hackers, Big bounty programs, familiarization with Common Vulnerabilities and Exploits (CVE), Nmap to locate attack vectors, Metasploit framework, Burp Suite for automated scanning.

Text Books:

1. Computer Networking -A top down approach – Kurose , Ross. Pearson.
2. Cryptography and Network security- William Stallings, Pearson

|--|--------------------------|
| Course Title and Code: Smart Material (ME1228) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech. VI Sem |
| Prerequisites | None |
| Weightage | Theory 60% Practical 40% |
| Course Objective: The objective is to introduce students to the basic concepts of smart materials and composites that are required for their design and fabrication as per the industrial applications. | |
| Course Outcomes: On successful completion of this course, the students will be able to: <ol style="list-style-type: none"> 1. identify various smart materials and its importance in engineering application 2. understand various processing techniques of smart materials 3. identify types of composites for various engineering applications 4. design various application based metal matrix composites | |

Course Syllabus (Theory):

Unit-1: Introduction to Smart Material

Introduction to smart materials. Classification of smart materials, Components of a smart System, Applications of smart material.

Piezoelectric Materials, Shape Memory Alloys, Shape Memory Polymers, Self-Healing Materials

Unit-2: Processing of Smart Materials

Metals and metallization techniques, Ceramics and their processing, Polymers and their synthesis, UV radiation curing of polymers. Smart material-based MEMS.

Unit-3: Introduction to composite

Define Composites, Reinforcements and matrices, Types of reinforcements, Types of matrices, Types of composites, Properties of composites in comparison with standard materials. Applications of metal, ceramic and polymer matrix composites.

Stiffness and Strength of composite: volume and weight fraction. Unidirectional continuous fiber, discontinuous fibers, Short fiber systems, woven reinforcements **Mechanical Testing:** Determination of stiffness and strengths of unidirectional composites in tension, compression, and fatigue.

Unit 4: Metal Matrix Composites

Characteristics of MMC, various types of metal matrix composites, alloy vs. MMC, Reinforcements, particles, fibers. Effect of reinforcement volume fraction rule of mixtures. Applications of MMC in aerospace, automotive industries

Processing of MMC: powder metallurgy process, diffusion bonding, stir casting, squeeze casting, a spray process, Liquid infiltration, measurement of interface properties.

Laminates: Lamina Constitutive Equations, basic assumptions of laminated anisotropic plates. Laminate Constitutive Equations, Balanced Laminates, Symmetric Laminates, Angle Ply Laminates, Cross Ply Laminates. Laminate Structural Moduli. Evaluation of Lamina properties from Laminate Tests.

Text Books:

1. Smart Material Systems and MEMS: Design and Development Methodologies, V. K. Varadan, K. J. Vinoy, S. Gopalakrishnan, John Wiley and Sons, England, 2006.

|--|--|
| Course Title and Code: Fundamental of Sustainable Development (ME1227) | |
| Hours per Week | L-T-P: 3-1-0 |
| Credits | 4 |
| Students who can take | B.Tech VI Sem |
| Prerequisites | Basic knowledge of physics and chemistry (Basic Science), Basic knowledge of the Environment |
| Weightage | Theory 55% Practical 45% |
| Course Objective: | |
| The goal of this course is to develop an understanding of the fundamental critical concepts on Sustainable Development (S.D.), such as intra- and inter-generational equity, economic, social and environmental sustainability; strong and weak sustainability; natural capitalism; steady state and green economy; | |
| Course Outcomes: | |
| After course completion, the student will be able to: | |
| <ol style="list-style-type: none"> 1. Explain the concept of Sustainable Development and its Role in Building of Environment 2. Identify the critical empirical issues on sustainable development, such as renewable energy transitions, urban agriculture, and green architecture and Analyze the effect of releasing toxic substances. 3. Distinguish between "green economy" and "sustainability" and various efforts at multiple governance levels: individual to the government. 4. Make their lives more sustainable and join social movements to achieve more sustainable development. 5. Apply appropriate theoretical knowledge of public policy and international relations to sustainable development. | |

Course Syllabus (Theory)

Concept of Sustainable Development:

Definition of sustainability; History and the emergence of the concept of sustainable development; Our Common Future; Objectives of Sustainable Development; Millennium Development Goals; Environment and Development linkages; Globalization and Environment; Population, Poverty and Pollution; Global, Regional and Local environmental issues; Resource Degradation; Greenhouse gases and climate Change; Desertification; Industrialization; Social insecurity.

Sustainability and The Triple Bottom Line:

Components of sustainability; Complexity of growth and equity; Social, economic and environmental dimensions of sustainable development; Environment, Biodiversity, Natural Resources; Ecosystem integrity; Clean air and water; Carrying capacity; Equity, Quality of Life, Prevention, Precaution, Preservation and Public participation; Structural and functional linking of developmental dimensions; Sustainability in the national and regional context.

Sustainable Development and International Response:

Role of developed countries in the development of developing countries; International summits; Stockholm to Johannesburg; Rio Principles; Agenda 21, Conventions, Agreements;

Tokyo Declaration; Doubling Statement; Transboundary issues; Integrated approach for resource protection and management.

Sustainable Development of Socio-Economic Systems:

Demographic dynamics of sustainability; Policies for socio-economic development; Strategies for implementing eco-development programmes; Sustainable development through trade; Economic growth; Action plan for implementing sustainable development; Urbanization and Sustainable Cities; Sustainable Energy and Agriculture; Sustainable Livelihoods, and Ecotourism.

Framework for Achieving Sustainability

Sustainability indicators; Hurdles to Sustainability; Operational guidelines; Interconnected prerequisites for sustainable development; Empowerment of Women, Children, Youth, Indigenous People, Non-Governmental Organizations, Local Authorities, Business and Industry; Science and Technology for sustainable development; Performance indicators of sustainability and Assessment mechanism; Constraints and barriers for sustainable development.

|---|----------------------|
| Course Title and Code: Motion Planning, Control, and Manipulation of Robots ME1222 | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech. VI Semester |
| Prerequisite: ME1226 Introduction to Robotics | |
| Weightage: Theory - 60%, Practical and Projects - 40% | |
| Course Objectives: The course aims to equip the students with basic fundamentals of robotic motion planning and control, and develop control functionality in robots. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1 Understand key concepts of robot motion generation. 2 Plan a motion for a robot for different situations including the presence of obstacles. 3 Develop real-time feedback control system and manipulation of the planned motion. | |

Course Syllabi (Theory):

Unit I Introduction: Introduction to robot motion planning, Basics of serial robotic arms and mobile robots, Transformations.

Unit II Motion Planning: Motion planning on a discretized C-space grid, C-space obstacles, C-space for mobile robots, C- Space for serial robotic arms, randomized sampling-based planners, Motion planning for multi robotic systems.

Unit III Robot Control: First- and second-order linear error dynamics, stability of a feedback control system, Motion control of robots using joint velocities and/or torques, force control, and hybrid motion-force control.

Unit IV Robot Manipulation: Kinematic constraint, graphical methods for representing kinematic constraints and forces/ torques in the plane, force closure grasping, and examples of manipulation.

| | |
|--|----------------------|
| Course Title and Code: Project in Robotics ME1223 | |
| Hours per Week | L-T-P: 1-0-6 |
| Credits | 4 |
| Students who can take | B. Tech. VI Semester |
| Prerequisite: ME1226 Introduction to Robotics | |
| Weightage: Practical and Projects - 100% | |
| Course Objectives: To develop basic robotic system(s) for real-life practical problem and preparing the students to be job ready in the domain of robotics and automation. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1 Critically analyze and use/choose suitable hardware components for the project. 2 Develop working model of the robot and control it using software/ remote. 3 Communicate project work among peers and develop soft skills needed in the industry. | |

Course Syllabus:

The course is project based. Basic guidelines of conducting the course are provided hereunder:

1. Students will work in team (number of team members in each team will be decided based on the students registered in the course).
2. Each team is expected to come with the novel project idea, discuss and get it approved from the instructor(s), and work on it throughout the course.
3. The projects could be of the following types:
 - a. Literature search (LS) type and systematic analysis.
 - b. Algorithm development (AD) type and/or implementation.
 - c. Design/synthesis (DS) of the final
4. One lecture per week will be taken to explain how to do literature survey, identify and analyze important results, find the software/ hardware (primarily open source) needed to successfully develop the project.
5. Student needs to submit high-quality technical report, a small video (preferably less than 60 seconds), and deliver a presentation of his/her work.

| Course Title and Code: Mechanics of Robots (ME1224) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech. VI Semester |
| Prerequisite: None | |
| Weightage: Theory - 60%, Practical and Projects - 40% | |
| Course Objectives: This course is aimed to provide the basic knowledge of kinematics and dynamics of the robotic system(s) essential to devise motion planning and control functionality in robots. | |
| Course Outcome: On successful completion of this course, the students should be able to: | |
| <ol style="list-style-type: none"> 1 Understand basic mathematical concepts to comprehend kinematics and dynamics. 2 Apply concepts of kinematics to develop robotic structure/ framework. 3 Design and develop static/dynamic stable robust robotic system. | |

Course Syllabi (Theory):

Unit I Mathematical Preliminaries: Spatial Descriptions: positions, orientations, and frame, mappings: changing description from frame to frame, Operators: translations, rotations and transformations, transformation arithmetic, compound Transformations, inverting a transform, transform equations, Euler Angles, Fixed Angles, Euler Parameters.

Unit II Robot Kinematics: Manipulator Kinematics, Link Description, Link to reference frame connections, Denavit-Hartenberg approach, Position representations, Homogeneous transformation matrix, Forward kinematics. Inverse kinematics, Geometric and analytical approach.

Unit III Velocities & Statics: Cross product operator for kinematics, Jacobians - Direct differentiation, Basic Jacobian, Jacobian in a frame, Kinematic singularity, Kinematics redundancy, Force balance equation, Velocity/force duality, Kinematics redundancy, Mechanical design of robot linkages,

Unit IV Robot Dynamics: Introduction to dynamics, Velocity kinematics, Acceleration of rigid body, mass distribution, Newton's equation, Euler's equation, Iterative Newton - Euler's dynamic formulation, Closed dynamic, Lagrangian formulation of manipulator dynamics, Dynamic simulation.

| Course Title and Code: Flexible Electronics EE1225 | |
| Hours per Week | L-T-P: 3 1 0 |
| Credits | 4 |
| Students who can take | B.Tech VI Sem |
| Prerequisite: None | |
| Weightage: Theory 70%, Assignment and Quiz 30% | |
| <p>Course Objectives:</p> <p>Gain a fundamental understanding of the field of organic and printed electronic materials, fabrication techniques and devices and their potential impact.</p> <ol style="list-style-type: none"> 1. Learn the fundamentals of flexible and printable electronics and deepen your understanding of them. 2. Develop a grasp of the link between soft matter electronics printing techniques, device performance, and intended applications. 3. Understand the fundamental concepts of device integration on flexible platforms, as well as the benefits and drawbacks of emerging technology that will be employed in future devices. 4. Acquire a basic knowledge of Future Trends in Flexible/Printable Electronics Technology, as well as the commercialization paths for new materials, methods, and tools for printed and flexible electronic systems. | |
| <p>Course Outcome:</p> <p>On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Understand the trends and technologies of flexible electronics and its road map. 2. Identify the materials used in the design and manufacturing of flexible electronic devices. 3. Recognize and introduce the various thin-film deposition techniques used in fabrication of Flexible and Printable electronics devices. 4. To provide an understanding of the structure and features of TFT devices. 5. Develop an ability to design a system, component, or process to meet desired needs using novel materials and devices. | |

Course Syllabus:

- 1 Motivation for study of organic and printed flexible electronics
- 2 Materials properties/synthesis of printable semiconductors:
Nanowire and nanoparticle synthesis, transition metal oxides, amorphous thin films, polymeric semiconductors, structure and property relationships, paper-based electronics, textile substrates, barrier materials.
- 3 Thin-film Deposition and Processing Methods for Flexible: Devices CVD, PECVD, PVD, etching, photolithography, low-temperature process integration
- 4 Introduction: display and lighting technology, solar cells and sensors
- 5 Organic and Printable Flexible Electronics (Flexible displays technologies, Flat panel lighting technologies, Flexible solar cells and Flexible electronics for RF applications)

- 6 Thin Film Transistors: Thin Film Thin Film Transistors device structure and performance. Fundamental issues for low-temperature processing, Low temperature thin-film transistor Devices, Device structures and materials processing, Low-temperature a-Si:H and a-IGZO thin-film transistor device performance, I-V characteristics, device stability.
- 7 Organic sensors (bio & chemical): Organic material synthesis and Deposition techniques, challenges and road block in fabrication and development of flexible and organic electronics devices.

|---|--------------------------|
| Course Title and Code: Mechanisms for Machines (IL1206) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech Semester-VI |
| Prerequisites | None |
| Weightage | Theory 40% Practical 60% |
| Course Objective: This course aims to build concepts and skills in the design of various mechanisms for machines. The interdisciplinary course includes understanding of sensors for various physical parameters of moving parts/machines. It will aid the domain of Automation courses like Robotics, Machine Vision, Internet of Things, and Industrial Instrumentation and Safety. | |
| Course Outcomes: After course completion, the student will be able to: | |
| 1. Identify various types of links and pairs for motions in machines | |
| 2. Select and use suitable mechanisms to converting one type of motion into Another | |
| 3. Select suitable sensors to measure physical parameters. | |
| 4. Develop suitable automated mechanism for machine. | |

Course Syllabus (Theory)

UNIT – I

Introduction to Links and Pairs:

Classification of mechanisms- Basic kinematic concepts and definitions- Degree of freedom, mobility- Grashof's law. Types of links, pairs and joints. **(10 lectures)**

UNIT - II

Transducer and Actuators:

Physical parameters, Measurement principles, Calibration, Amplification, Mechanical and Electrical Actuators, Closed loop systems for automation. **(10lectures)**

UNIT – III

Mechanisms for Motion Conversion:

Introduction to four bar chain mechanisms and their inversions for various applications, Introduction to single slider crank chain mechanisms and their inversions for various applications, Introduction to double slider crank chain mechanism and their inversions for various applications. Mechanisms for balancing of ships and aeroplanes. **(10 lectures)**

UNIT – IV

Mechanisms for Motion Transmission:

Power transmission through chain, rope and belt drive. Mechanisms for precise and compact power transmission through gears, cam and follower, and lead screws.

| Course Title and Code: Project | |
| Credits | 4 |
| Students who can take | B.Tech Sem VII |
| Prerequisites | None |
| Weightage | Report and Project 100% |
| <p>Course Objective- This course offers an opportunity to apply and extend knowledge learned throughout the program to solve real world issues. The projects undertaken span a diverse range of topics, including design, simulation, and experimental studies. The course emphasizes, facilitating student learning in technical, project implementation and presentation spheres.</p> | |
| <p>Course Outcome: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Identify and formulate industrial and societal problems. 2. Design engineering solutions for complex problems. 3. Develop/fabricate, and implement solutions for identified problem. 4. Demonstrate the knowledge, skills and attitudes of a professional engineer. | |

| | |
|--|--|
| Course Title and Code: Computer Vision (CS1228) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B.Tech. VII Sem and BCA 5 th Sem |
| Prerequisites | Computational Data Analysis, Machine Learning, Deep Learning |
| Evaluation | Theory 55%, Lab 45% |

Course Objective: This course introduces the fundamental concepts of image and video-based features and how to use them for training ML/DL models for recognition tasks. It will cover object detection, segmentation, convolutional network model construction and training pipeline for image/video-based recognition applications. The course will also discuss the end-to-end development of state-of-the-art machine learning and deep learning models used in computer vision. This course will provide a hands-on state-of-the-art experience with tools and libraries used for building a vision pipeline.

Learning Outcome:

On successful completion of this course, the students should be able to:

1. Understand the fundamentals of Image Processing, Computer Vision and its applications.
2. Learn about the major vision tasks (detection, recognition, segmentation and tracking) along with their evaluation methodology.
3. Learn about state-of-the-art deep learning models for solving the major vision tasks applied for images and videos.
4. Learn the tools and techniques for implementing the core functionality of a computer vision system.
5. Identify the domain-specific requirements and build custom image/video processing learning based models and pipeline.

Course Syllabus (Theory):

UNIT-I: *Introduction to Image Processing and Computer Vision:* Image Formation, Digital Camera, Image data representation, Color Spaces, Filtering, Histogram Equalization, Fourier Transforms, Pyramids, Wavelets, Edge Detection, Image Features.

UNIT-II: *Convolutional Neural Networks (CNN) - Features and Applications:* CNN architectures for Classification, and Detection tasks (AlexNet, VGG, ResNet, FasterRCNN, MaskRCNN, YOLO). Video action classification features and models (Two-stream, 3DCNNs).

UNIT-III: *Spatial Features and working with video data:* Low level image features - SIFT, HOG, LBP. Face/Pedestrian/Object Detection, Video data representation, RGBD, background modeling / subtraction, MBH, BoVW based model training. Semantic Segmentation.

UNIT-IV: *Motion understanding:* Optical Flow, Shot Boundary Detection, detection and tracking in videos, Trajectory extraction (iDTs), trajectory clustering, FlowNet, SLAM.

UNIT-V: *Benchmark Datasets and Video Action Recognition:* Large-scale datasets, ActivityNet, Kinetics, AVA, TRECVID. Transformer Models, ViT, PixelCNN, Self-supervised learning on videos. Generative models. Applications of Action Recognition. Eigen Faces.

|--|--------------------------------------|
| Course Title and Code: Fundamentals of Investing (FA1127) | |
| Hours per Week | L-T-P: 4-0-0 |
| Credits | 4 |
| Students who can take | B. Tech Semester-VII Elective |
| Pre-requisite | None |
| Weightage | Theory 70% Practical 30% |

Course Objective:

The income that a person receives may be used for purchasing goods and services that he currently requires or it may be saved for purchasing goods and services that he may require in the future. In other words, income can be what is spent for current consumption. savings are generated when a person or organization abstain from present consumption for a future use. The person saving a part of his income tries to find a short term or long term investment avenues for his savings until they are required to finance his future expenditure, this result in investment.

The course is primarily designed for novice investors who want to better understand the concept of investing and investment decision making. This course will cover different investment vehicles, Time value of money and power of compounding, balancing risk and return, project valuation and the capital budgeting process, financial services and institutions.

Course Learning Outcomes:

After course completion, the student will be able to:

1. Comprehend the fundamentals of investment and different investment vehicles.
2. Evaluate and Explore the effects of investments on personal finances
3. Apply the concept of Time value of money to your personal finance and retirement planning.
4. Analyze viability of different projects for investment decision making.
5. Comprehend the role of financial markets and intermediaries and financial services.

Course Syllabus (Theory):

Module-I Investment Environment

The investment decision process, Types of Investments – Commodities, Real Estate and Financial Assets (Equity, Mutual funds, Debt), Introducing investment tools- Deposits, Bonds, saving schemes such as PF, PPF, NPS, SSY, NSC, Post office saving schemes, Insurance- Term, Endowment plans, Gold, SGBs etc.

Module-II Time Value of Money and balancing Risk and Return

Fundamental Valuation Concept- Time value of Money: Concept and Rationale, Compounding and Discounting of cash flows. FV & PV of Annuity, Risk & Return Trade.

Module-III Project Valuation and capital budgeting process

Capital Budgeting: Capital budgeting process, Non-Discounting cash flow techniques, Discounting cash flow techniques, Accept Reject Rules.

Module IV: Introducing Financial Markets and Institutions: The Indian securities market, the market participants (Stock exchanges, Stock brokers, Clearing House, Depositories, Depository Participants, FIIs, Domestic institutional investors, Individual investors), Online and offline trading in securities, security market indices, sources of financial information.

|--|--------------------------------------|
| Course Title and Code: Operations Research (AS1201) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech Semester-VII Elective |
| Pre-requisite | None |
| Evaluation | Theory – 70%, Lab – 30% |

Course Objective:

This Course aims to develop various concepts and tools to help students understand operations research and mathematical modeling methods. To introduce the students to the advanced methods for large-scale decision analysis, supply chain management, and reliability problems.

Course Outcomes: After course completion, the student will be able to:

- 1 Determining the characteristics of different types of decision-making environments and the appropriate decision-making approaches and tools to be used in each type.
- 2 Formulate and translate a real-world problem, given in words, into a mathematical formulation.
- 3 Use these tools to analyze strategic, tactical, and operational supply chain decisions including facility location, vehicle routing, and inventory management.
- 4 Improve decision-making by identify minimize trouble spots by identifying the critical factors.
- 5 Find reliability and operation analysis which includes system reliability analysis, failure investigation and corrective action.
- 6 Know how to work in a team, specifically to solve larger problems, communicate technical knowledge, partition a problem into smaller tasks, and complete tasks on time.

Course Syllabus (Theory)

Decision Analysis

Introduction to OR, Introduction to Decision Analysis, A Prototype Example, Decision Making without Experimentation, Decision Making with Experimentation, Decision Trees.

Markov Chain

Introduction to Markov Chain, Stochastic Processes, Chapman-Kolmogorov Equations, Classification of States of Markov Chain.

Supply Chain Analysis and Inventory Management

Introduction, Introduction to Supply Chain Management and Supply Chain Strategy, Supply Chain Performance Metrics and Drivers Objectives of Inventory Control, Types of Inventories.

Network Optimization Models

The Terminology of Networks, Shortest-Path Problem, Minimum Spanning Tree Problem, and Project Management with CPM/PERT.

Reliability Theory

Introduction, System Reliability, Failure Rates, Bath-tub, Reliability of Systems, Practical Utility of Reliability Evaluation.

|---|---|
| Course Title and Code: Behavioral Assessments for Employability (BS1105) | |
| Hours per Week | L-T-P: 4-0-0 |
| Credits | 4 |
| Students who can take | B. Tech Semester-VII Elective |
| Pre-requisite | None |
| Weightage | Presentations 20% Assignments 40% Reports 30% Participation 10% |
| <p>Course Objectives: This course aims to enhance student’s self-awareness, and to expand their capacity of self -management and development. Human Behavior is manifestation of certain innate and learned competencies. These competencies encompass intelligence, knowledge, skills, attitudes and actions. Right behaviors are precondition for excellence in other competencies. Further technical knowledge and skill can be taught vis-a- vis behavioral competencies are consciously developed through self-awareness. It immerses them to understand the key behavior and attitude assessed by the employer in job market and makes them undergo various psychological test. By the end of the course students will be able to develop their psychological assessment profile and identify their strength. This would enable their personal growth and help them project right behavior and attitude while seeking employment</p> | |
| <p>Course Outcomes: On successful completion of this course, the students should be able to:</p> <ol style="list-style-type: none"> 1. Create awareness about different types of psychological tests in vogue. 2. Provide a theoretical background for supplementing the understanding of psychological assessment. 3. Learn to interpret test profiles and explore patterns in interpretation from several tests. 4. Explore and identify their core personal strengths and values. 5. Identify and expand their capacity of development | |

Topics :

- Theory and Issues in Psychological Testing
- Intelligence Testing - Theoretical Background
- Aptitude Testing - The D.A.T.
- Personality Assessment - Theoretical Background
- Self-Report Inventories
- Assertiveness Test
- Stress Assessment
- Ego states & life positions
- Growth mindset
- Ethics assessment
- Typological Tests
- Projective Techniques
- Integration of Profiles

|--|--------------------------|
| Course Title and Code: Solid and E-Waste Management (AS1210) | |
| Hours per Week | L-T-P: 3-1-0 |
| Credits | 4 |
| Students who can take | Open Elective |
| Pre-requisite | None |
| Weightage | Theory 55% Practical 45% |
| <p>Course Objective: This course provides an in-depth understanding of solid and hazardous waste characteristics and management. This course will also discuss the overall scenario of E-Waste management. This imparts life skills about E-waste management in routine daily life to minimize the different wastes and apply effective management throughout society.</p> | |
| <p>Course Outcome: After course completion, the student will be able to:</p> <ol style="list-style-type: none"> 1. Analyze key sources, typical quantities generated, composition, and properties of solid and hazardous wastes. 2. Compare effective methods of solid & hazardous waste handling and segregation of wastes at source. 3. Test the most common techniques for preventing, minimizing, recycling, disposing, and treatment of solid and e-waste and their application in on-site remediation. 4. Recognize the important regulations which are applied for the effective management of solid and E-wastes. 5. Use engineering methods to identify, formulate, and solve waste problems. | |

Course Syllabus (Theory):

INTRODUCTION: Types and Sources of solid wastes and E-waste- Indian and global scenario of the - Need for solid and E-waste management – Indian and global scenario of e-Waste, Growth of Electrical and Electronics industry in India, E-waste generation in India, Composition of E-waste, Possible hazardous substances present in E-waste, Environmental and Health implications.

WASTE LEGISLATION: Legislations on management and handling of solid waste. The regulatory regime for e-waste in India, the hazardous waste (Management and Handling) rules 2003, E-waste management rules 2015, Regulatory compliance including roles and responsibilities of different stakeholders – producer, manufacturer, consumer, etc., Proposed reduction in the use of hazardous substances (RoHS), Extended producer responsibility (EPR).

WASTE PROCESSING & TECHNOLOGY: Composition - Hazardous Characteristics –Source reduction of wastes – Recycling and reuse. Handling and segregation of wastes at source – storage and collection of solid & E-wastes – Analysis of Collection systems - Need for transfer and transport – Transfer stations - labeling and handling of hazardous wastes. Processing technologies – thermal conversion technologies - energy recovery – incineration. Life cycle assessment of a product (LCA) method, Emerging recycling, and recovery technologies

DISPOSAL: Guidelines for environmentally sound management of e-waste, environmentally sound treatment technology for e-waste, Disposal in landfills - site selection - design and operation of sanitary landfills- secure landfills, leachate, and landfill gas management. Case studies, and unique initiatives from around the world. Case study -Optimal planning for computer waste.

|---|--------------------------|
| Course Title and Code: Disaster Management (CE 1206) | |
| Hours per Week | L-T-P: 3-1-0 |
| Credits | 4 |
| Students who can take | B. Tech Sem VI (OE) |
| Prerequisite | None |
| Weightage | Theory 50% Practical 50% |
| <p>Course Objective: This course aims to develop understanding of various natural and manmade disasters. Natural disasters include earthquake, Tsunami, Flood, forest fires and Land Slides. Manmade disasters include fire, Industrial Pollution, embankment failure, structural failure and due to electric supply. Topics includes the causes for these disasters and remedial measures which can minimize the losses to the life and property. The course also includes the identification and description of electric supply resilience and restoration.</p> | |
| <p>Course Outcomes</p> <p>On completion of the course, the student should be able to:</p> <ol style="list-style-type: none"> 1. Asses the types of disasters, causes and their impacts. 2. Assess vulnerability and various methods of risk reduction measures and mitigation. 3. Draw the hazard and vulnerability profile of a given region. 4. Analyze the impact of Storms and Severe Weather on electric utility. 5. Plan and execute framework to black start and restoration procedure with considering security criteria and power system reliability. | |

Course Syllabus (Theory)

Unit-1 Introduction to Disasters, Various types of disaster, Natural: Flood, Earthquake, cyclone, Land slide, Manmade: Fire, Industrial Pollution, embankment failure, structural failure, Loss of resources.

Unit-2

Risk and Vulnerability:

Risk: Its concept and analysis, Risk reduction, Vulnerability: Its concept and analysis, strategic development for vulnerability reduction

Unit 3

Disaster Management in Electrical Systems:

Causes of Extended Outages, System Impact of the Loss of Major Components, Methods to Reduce Energy System Vulnerability, Development of an On-Site and Off-site Disaster management Plan, Accident prevention techniques and Reporting procedures, Investigation reports, Impacts of Blackouts.

Unit – 4

Management- Objectives, Processes, Events, analysis, base-line data, forecasting and Warnings. Disaster preparedness plan concept and nature, Emergency operation center and IT aids- physical environment, Applications. Public-private agency co-ordination- federal, state and local disaster response organization and network, Citizen and community role in disaster response and recovery.

| Course Title and Code: Practice School – II (PS-2), PS1102 | |
| Total Duration | 4-4.5 months |
| Credits | 16 |
| Students who can take | B.Tech Semester-VIII |
| Prerequisites | None |
| Weightage | Practical 100% |
| Course Objective: | |
| The aim of this course is to expose students to the real-world industrial environment to acquire knowledge of various professional skills, working of industry, and interaction with the people. Practice school-II is essential to inculcate confidence and encourage to take-up professions/entrepreneurship to serve the society in general | |
| Course Outcomes: | |
| On successful completion of Practice school-II, the students be able to: | |
| <ol style="list-style-type: none"> 1. Apply skills and engineering knowledge to identify various Industrial problems. 2. Analyze and solve engineering related problems in industry using methods, tools and techniques learnt at the university. 3. Demonstrate ethic and professionalism in engineering practice. 4. Communicate effectively with the technical community and produce effective reports and presentations | |

| | |
|--|-----------------------|
| Course Title and Course Code: Entrepreneurial Project (PR1105) | |
| Duration | 16 weeks |
| Credits | 16 |
| Students who can take | B. Tech Semester-VIII |
| Prerequisites | None |
| Weightage | Practical 100% |
| Course Objectives: | |
| The aim of this course is to expose students to the entrepreneurship in computer science. The students are expected to identify new business opportunities in the technology sector, innovate and create a solution and finally implement Business strategy. | |
| Course Outcomes: | |
| On successful completion of Entrepreneurial Project, the students will be able to: | |
| <ol style="list-style-type: none"> 1. Apply skills and knowledge to identify new entrepreneurial opportunities 2. Analyze the market and competitors around the identified opportunity 3. Innovate, Design and Create the specific product or solution 4. Develop a business model for the entire solution | |

| | |
|---|-----------------------|
| Course Title and Course Code: Research Project (PR1104) | |
| Duration | 16 weeks |
| Credits | 16 |
| Students who can take | B. Tech Semester-VIII |
| Prerequisites | None |
| Weightage | Practical 100% |
| Course Objectives: | |
| The aim of this course is to expose students to the research conducted in computer science. The students are expected to identify, formulate and solve a research problem. | |
| Course Outcomes: | |
| On successful completion of Research Project, the students will be able to: | |
| <ol style="list-style-type: none"> 1. Apply skills and knowledge to identify research problems. 2. Analyze the related work around the identified research problem. 3. Design efficient solutions to solve the identified problem. 4. Evaluate, test and compare the methodology used to solve the problem. | |

| | |
|---|----------------------------|
| Course Title and Code: Optimization for Computer Science (AS1113) | |
| Hours per Week | L-T-P: 3-0-2 |
| Credits | 4 |
| Students who can take | B. Tech IV Sem (CSE/CS+AI) |
| Evaluation | Theory – 70%, Lab – 30% |
| Course Objective: Optimization problems are prevalent in numerous fields, including machine learning, reinforcement learning, signal processing, and networks. This course develops into the fundamental principles of continuous optimization and provides a comprehensive overview of unconstrained and constrained optimization problems. | |
| Course Outcomes: On successful completion of this course, the students should be able to: 1. formulate real-world problems as mathematical optimization problems. 2. analyze and choose appropriate optimization methods for specific problem domains. 3. implement and use optimization algorithms, such as gradient descent and evolutionary methods, 4. Recognize the computational complexity of optimization problems and strategies for handling large-scale instances. | |

Course Syllabus (Theory):

Introduction to Optimization

Overview of optimization problems and their types (continuous, discrete, constrained, unconstrained). Formulation of optimization problems (objective functions, decision variables, constraints). Local vs. global optimization.

Nonlinear programming

Convex sets and convex functions, their properties, convex programming problem, generalized convexity, Pseudo and Quasi convex functions, KKT conditions.

Search Techniques

Direct search and gradient methods, Unimodal functions, Fibonacci method, Golden Section method, Method of steepest descent, Newton-Raphson method, Conjugate gradient methods.

Dynamic Programming

Characteristics of Dynamic Programming Problems, Deterministic and Probabilistic Dynamic Programming.

Nature Inspired Algorithms

Genetic Algorithms, Binary and Real coded Genetic Algorithms, Coding and decoding of variables, Key steps in a GA, starting population, fitness evaluation, reproduction, crossover, mutation, evaluation.
